* Segundo Ruiz Belvis Neighborhood Family Care Center, Bronx, N.Y., USA
** Center for Community Action to Prevent AIDS, Hunter College, N.Y., N.Y. USA

Objective: To describe an AIDS Prevention Project in a Latino community in the South Bronx.

Methods: Investigators conducted 30 semi-structured interviews with health center staff and leaders of community organizations - schools, churches and housing projects.

Results: Factors contributing to an effective partnership between an AIDS prevention project and community groups included a clearly defined common agenda, previous experience working on drug and sex related issues, a participatory planning process, and a project staff sensitive to socio-cultural issues.

Conclusion: An effective partnership can be established between health centers and community organizations to bring AIDS prevention messages to populations at risk of HIV infection.

E.559

THE EPIDEMIC SPREAD OF AIDS LITERATURE AND ITS IMPLICATION FOR THE MANAGEMENT OF THIS CRISIS

Debbie Indyk, Mt. Sinai School of Medicine, NYC, NY, USA

Objective: To identify the major gatekeepers and networks that serve the various publics concerned with the state of the field and to examine and compare the roles played by these assessors in the dissemination of new findings and information regarding AIDS.
Methods: The major gatekeepers examined are 1)communications from the CDC; 2)MEDLINE; 3)the UPI wire service; 4)the AIDS clearinghouse (NAIC) and ; 5)a self-appointed specialized AIDS news service's current awareness summaries. A typology was developed which was used to classify articles which appeared during the past year by study type, coverage, approach, and time of appearance in each of the five datasets.
Results: Multiple examples of the almost simultaneous appearance of these tentative 'findings' (ie case reports, drug trials, therapeutic interventions, prevention models) in scientific communications, informal networks, the journal literature and mass media were identified. In addition, many examples of instant codification of cutting-edge work in progress research findings into tertiary textbook literature were found.
Conclusion: The crisis brought on by the AIDS epidemic, coupled with the speed with which research findings become incorporated into the bibliographic network and into practice, have truncated the stages of assessment and evaluation traditionally required before new knowledge becomes codified. Structures, roles and mechanisms must be created which will allow for the more scientific assessment of findings and reduce the risk of their premature incorporation into practice.

E.556

SEGMENTING THE MARKET OF BLACK GAY MEN FOR AIDS PREVENTION EDUCATION AND RISK REDUCTION

N.Dey,* Toby Marotta PhD,* (*Polaris Research and Development, San Francisco, CA USA)

Objective To develop an analytic model for defining and differentiating between subgroups of Black men who have sex with other men for purposes of segmenting them for AIDS prevention interventions
Methods A review of the literature and ethnographic research led to development of a three dimensional matrix that differentiates between subgroups values, associational patterns, and communication styles and channels The matrix locates Black men who have sex with other men in terms of the extent to which they self-identify as gay, bisexual or heterosexual, the degree to which they are Black-identified in terms of cultural style and attitudes; and their socioeconomic class (as measured by occupation, education, and income)
Results Subgroups identified to date include Black gay intellectuals (men who are high on all three dimensions of the model), Black transvestite prostitutes (men who are Black identified, gay identified, and low on the socioeconomic scale), Black street hustlers (men who are Black identified, heterosexually identified, and low socioeconomic), Black bisexual professionals (Black identified, non-gay identifed, and mid to upper socioeconomic), gay-identified Black men (primary identification as gay, low to moderate Black identity, mid to upper income)
Conclusions Black men who have sex with other men and who are at-risk of AIDS as a result of their behaviors do not all share the same values, do not all engage in the same behaviors, do not get their information from the same sources or find the same sources credible Given their differences they require different messages delivered through different media.

E.558

COMMUNICATING RISK ABOUT HIV INFECTION

Kroger, Fred*; Shepherd, M.*; Rosenberg, M.*; Wilson, R.*. Centers for Disease Control, Atlanta, Georgia, USA

Objective. To describe the problems and processes associated with communicating risk information to a national audience; effectiveness to date.
Methods. The United States Public Health Service has used a variety of vehicles to inform the American public, including persons at high risk, what factors increased risk of exposure to human immunodeficiency virus (HIV) infection, how risk could be reduced, and what situations entailed low or no risk to uninfected persons. These efforts are often complicated by political, social, scientific, and resource constraints. The effectiveness of these efforts is monitored through a continuous, cross-sectional household survey that measures HIV/AIDS knowledge and attitudes in a probability sample of noninstitutionalized adults (18 years and older).
Results. American adult citizens are very knowledgeable about how HIV is transmitted. Knowledge levels about true transmission risk factors range from 92% to 98%. Erroneous notions about transmission risks remain disturbingly high, though steady improvement has occurred over the past 18 months.
Conclusion. Translating scientific findings into understandable and believable communications requires equally scientific rigor. Misperceptions, once established, are difficult to eradicate.

E.560

CONTENT ANALYSIS OF AIDS EDUCATIONAL MATERIALS IN THE UNITED STATES

James A. Wolk PhD*, Randall L. Sell MA*, Amy Will BS*, Portia DeFilippos BS*
* The Project Hope Center for Health Affairs, Washington, DC, USA.

Objectives: 1) To develop categories based on social learning theory for classifying the content of AIDS educational messages, 2) To describe the distribution of these categories in a representative sample of materials in the US, 3) To profile common patterns of message content and their association with types of media and targeted audiences, 4) To correlate ratings with the judgements of a panel of AIDS education experts who independently assessed the quality of materials.
Methods: A random sample of AIDS educational materials was derived from the AIDS Information Resources Directory (American Foundation for AIDS Research, 1988.) The 4 categories of media are brochures, cards, and inserts (n=104), pamphlets, books, and monographs (n=41), posters (n=44), and videos (n=60). The samples are classified by target group including minorities, drug users, gay/bisexual men, children/adolescents, HIV test-takers/HIV positive, and others. Ratings are performed by two raters; inter-rater reliability is assessed in a separate sample using Cohen's kappa.
Results: The content categories based on social learning theory are: Factual including epidemiology, transmission, community resources, testing and legal issues; Motivation- Target and risk groups, symptoms, AIDS imagery, risk behaviors, safe sex; Risk Reduction- Practical and interpersonal skills; Costs/Benefits- Tangible and intangible; Other- Mood, prompts, vernacular and AIDS-related terms; Design/Layout; and Human Models- Characteristics, performance, rewards, emotional response. Kappas on 11 Factual items in 9 brochures are distributed: 1=0.4, 1=0.6, 1=0.8, 8=1.0. Efforts have been made to improve reliability where deficient. Ratings of the AIDS education experts have been obtained from the American Foundation for AIDS Research.
Conclusions: Categories for classifying the content of AIDS educational materials can be derived from social learning theory. Preliminary results indicate that inter-rater reliability is adequate.

E.561

INNOVATIVE APPROACHES TO SCHOOL-BASED AIDS EDUCATION

Britton, Patti*; Felder, Cherri*; Fetro, J.* and Volcan, K.*.

*Education, Training and Research Associates, Santa Cruz, California, U.S.A..

Objective. To describe a national school-based AIDS prevention education teacher training project.
Methods. The Teaching AIDS Training Project, developed by ETR Associates and supported by the U.S. Centers for Disease Control, was designed to increase the number of junior/middle and senior high schools nationwide providing effective AIDS prevention education that is locally determined, consistent with community and family values, and appropriate to community needs. In 1988 five Texas sites (Arlington, Austin, El Paso, Harlingen and Houston) were selected to receive training for experienced family life educators with a commitment to school-based education about AIDS. By September 30, 1988, 242 experienced health or family life education teachers received the two-day AIDS Teacher Training, resulting in the implementation of AIDS prevention education for over 8,000 junior and secondary level students. After completing the 2-day training, participants were asked to rate each training activity for usefulness and quality on a Lickert-type scale. Mean scores for usefulness of activities ranged from 4.07 to 4.82 and quality of activities ranged from 4.14 to 4.86 (highest possible score was 5). A pre-post instrument was developed to measure participant's knowledge about AIDS, HIV transmission modes, at-risk behaviors, and participants' attitudes towards Persons With AIDS. Mean scores from the pre/posttest showed statistically significant increases in participant knowledge and attitudes.
Conclusion. Positive responses were expressed by training participants underscoring the deep commitment and need for providing direction in how to prevent the spread of HIV/AIDS among youth.

E.563

COMPARISON OF ATTITUDES TO AIDS IN 12 COUTRIES AMONG THE GENERAL POPULATION

L.G.M. RODRIGUES
Division of Sexually Transmitted Diseases and AIDS
Ministry of Health-Brazil

In 1987, the Gallup Organization, Conducted a survey to look at attitudes to the disease in 12 countries including Brazil.

The objectives of the research were: (1) to know attitudes related to some issues in order to set up priorities, for public education and (2) to draw conclusions about the strategies to be used in the future to prevent the epidemic.

Methods: A questionnaire was developed and carried out though domiciliar visits. In Brazil 1200 persons of both sex were interviewed.

The population sampled was randomized and proportional to the size of the administrative regions.

The questions were related to: "the most urgent health problem facing the country at the present time", Will AIDS hit everyone ?; Am I at risk ?; fear at the office ?; attitude of compassion and solidarity ?; AIDS reach only homosexuals, IV drug users, hemophiliacs, etc.

Conclusion: The data show, that awareness of AIDS is very high, but also show that people are not taking the steps to change their sexual behavior. Substantial numbers of people in many parts of the world still refuse to work with an infected person and that around the world misconceptions are still common. Finally the research also suggests, that people will be able to deal with AIDS in a humane way, since right information be provided.

E.565

SEXUALITE ET CONNAISANCE DU SIDA CHEZ LES LYCEENS ET LES JEUNES FEMMES DE DAKAR ET BANLIEUE

YOUSSOUPH M'BARGANE GUISSE ET LUDOVIC D'ALMEIDA PLURALE BP. 5356 DAKAR.

OBJECTIFS Les objectifs de cette enquête sur le SIDA visent à déterminer des groupes cibles, d'évaluer leur niveau de connaissance de la maladie, d'identifier les pratiques, habitudes et conduites culturelles autour de la sexualité, la contraception, les MST et le SIDA, de participer à la conception de l'information, de participer à la conception et à la realisations des actions de prévention du SIDA. Les groupes cibles sont ici des individus en activité sexuelle évidente: des femmes fréquentant des centres de PMI nombre de 400 au et des individus seuil réel désiré d'activités sexuelles: des lyceens (ennes) de collèges à Dakar au nombre de 122.
METHODOLOGIE: Un questionnaire comprenant le 4 grands thèmes envoyés a été élaboré et complèter par des interviews semi- directives industrielles et collectives.

RESULTATS: Les résultats de l'enquête montre que la sexualité du niveau de celle de la population cible est très libre: précocité, fréquence des rappots sexuelles, multipartenariat, recherche de plaisir multiforme. Ceci avec des nuances en rapport avec le niveau d'instruction, le sexe.Utilisation relativement faible des preservatifs ainsi que le multipartenariat encore persistant montre le divorce existant entre un niveau d'information grandissant et des moeurs et pratiques sexuelles très peu contrôlées.CONCLUSION: L'enquête ouvre des pistes pour améliorer et créer des instruments d'information plus adéquats et plus conformes aux réalités sociologiques et culturelles.

E.562

AIDS RELATED KNOWLEDGE IN A SAMPLE POPULATION FROM A PRIMARILY BLACK, INNER CITY AREA OF THE U.S.A.

Baker, James L.*; Celentano, D.**; Benedict, A.**; and Sonnega, J.**
*The Johns Hopkins University School of Medicine and **JHU School of Hygiene and Public Health, Baltimore, Maryland, USA.

Objective: To determine the existing level of AIDS related knowledge in a sample population from an impoverished, primarily black, inner city area of the United States.
Methods: 398 individuals, accessed through a hospital waiting area, were interviewed using a standardized question set developed by the U.S. National Center for Health Statistics.
Results: In our study population, 73% of whom were black and 77% of whom had 12 or fewer years of education, AIDS related knowledge was at least equal to that of the general population in the United States by comparison of results with identical NCHS questionnaires. Specifically, 99% were aware that AIDS is an ultimately fatal illness, 98% knew that the virus can be transmitted by sharing of needles in drug abuse and 96% knew that either homosexual or heterosexual sexual contact may result in transmission. In virtually all AIDS related subject areas examined, the knowledge level in this sample population was either equivalent to or greater than that known to exist in the general American population.
Conclusion: Efforts to control the HIV epidemic in inner city areas may need to focus much less on increasing simple cognitive awareness, and much more on methods of behavioral modification.

E.564

E.566

ISSUES IN THE SELECTION, TRAINING AND DEPLOYMENT OF AIDS COMMUNITY HEALTH OUTREACH WORKERS: THE SAN FRANCISCO MIDCITY PROJECT.

Biernacki, Patrick; Feldman, H.; Knapp, T.; Margolis, E.; Norman, P.
Youth Environment Study, Inc., San Francisco, CA, USA.

Objective. This 3 year old project was created to intervene in the AIDS epidemic among intravenous drug users (IVDUs) through the use of trained workers (CHOWS) who educate the target groups wherever they can be found.
Methods. The methods of selecting, training and deploying AIDS health outreach workers revolve around a series of issues. Examples of these issues are as follows. Should ex-addicts or non-addicts be selected as outreach workers? Are the best training recruits judgmental or non-judgmental about drug use and alternative lifestyles? What perspective works best for CHOWS, psycho-social or socio-historical? "How far to go," educator or case worker? Confidentiality: a legal and research issue vs confidentiality on the streets. Political and pragmatic considerations in deploying CHOWS.
Results. In the areas where CHOWS have been deployed, their work has had a dramatic impact. An independent survey has shown an increase in needle using hygiene (e.g. cleaning needles between uses with bleach) from 39% in 1986 to over 70% in 1988. The same population reported an increase in the use of condoms from 23% in 1986 to 42% in 1988.
Conclusions. Outreach education has shown great promise in changing the behavior of IVDUs.

E.567 MAINSTREAMING AIDS EDUCATION VIA COMMUNITY BASED HOTLINES

Catanzaro, M., Miles, T., Spirchandler, D., Spellman Center
St. Clare's Hospital and Health Center, New York, New York, U.S.A.

Objective. To evaluate the educational outreach of the volunteer staffed hotline at St. Clare's Hospital, NYC (a comprehensive AIDS Care Facility).
Methods. Training of volunteers is by Hospital professionals which includes: 1) interview 2) orientation 3) education 4) "Buddy System" and 5) follow-up individual and group support. As a toll-free National Hotline, outreach is National, contiguous states and the local community.
Results. In 1988, the number of calls averaged 500 per week representing a decline of 50% since 1987. The geographical distribution of calls remained the same in 1988 as in 1987. Ninety percent of the calls from New York, 6.3% from contiguous states (New Jersey, Pennsylvania and Connecticut) and 3.3% from other states and Puerto Rico. The intensive educational training enables volunteers to disseminate accurate, timely information on AIDS transmission and offer psycho-social support to callers freeing hospital professionals from such routine queries.
Conclusion. The decrease of calls could be attributed locally to the increasing publicity of AIDS Hotlines throughout the tri-state area and nationally, to the increase of AIDS services and resources. Decentralizing hotlines from national or state sponsorship to community health organizations and local hospitals gives the public greater accessibility and options to receive information and referrals. Mainstreaming volunteers addresses those concerns which allow hospital personnel to concentrate their time on effective patient care.

E.568 DEVELOPING AN AIDS CURRICULUM FOR OUTREACH WORKERS

Ashery, Rebecca S.
National Institute on Drug Abuse, Rockville, Maryland USA

Objective. To present curriculum content needed to train indigenous outreach workers to educate and motivate addicts to engage in risk reduction behaviors.
Methods. By anecdotal information gathered by informal survey with 58 sites around the USA which are NIDA funded outreach research demonstration projects.
Results. An informal survey indicated a myriad of training needs for outreach workers. Primarily, many outreach workers find it difficult to work within the framework of a research project because of the logkeeping, field notes and additional paperwork involving number of contacts, type of contacts, etc. that are necessary in such a project. A ranking of training requests from NIDA research demonstration projects indicates the need for skill building in basic outreach strategies. This includes the do's and don'ts of appropriate street outreach conduct, troubleshooting situations that will arise while conducting outreach activities, developing rapport building skills, developing and practicing "active listening" etc. Although most of the outreach workers are ex-addicts, many programs indicated a need for workers to understand both the pharmacology and psychosocial aspects of addiction including immune system impact.
Conclusion. From this needs assessment a core curriculum consisting of 13 modules was developed and delivered to outreach workers in NIDA funded projects.

E.569 LET'S TALK! ONTARIO MINISTRY OF HEALTH AIDS HOTLINE

Shtun, Pamela*; Lum,L.**; Hillier, W.***.
*City of Toronto, Department of Public Health, Toronto, Ontario, Canada, **University of Toronto, Toronto, Ontario, Canada,***Street Outreach Services, Toronto, Ontario, Canada.

Objective: To provide a comprehensive telephone service to residents of Ontario, as part of The Ministry of Health multimedia AIDS Education Program.
Method: A staff of 35 well-trained telephone operators provide services seven days a week, fourteen hours per day. Callers are provided with 1) information on epidemiology, transmission, prevention of HIV virus 2) crisis counselling, 3) referral to appropriate community resources.
Results: Major trends in the type of services provided to callers:

Type of Service	Content	Frequency
I Basic Education	Oral sex, casual contact intercourse and general information	87%
II Counselling	Behaviour change re: safer sex	18%
III Referral	Medical/dental care/support/psycho-social issues Health Unit Advocacy/legal/compliant	17%

Characteristics of the Caller:
Sex: 54% male 42% female 4% unknown sex
Sexual Preference: 16% same gender 4% bisexual 47% other gender 33% unknown
Age Group: 39% (0-19yrs);26% (20-29yrs);16% (29-39yrs);7.5% (39+yrs);11.5% Unknown
Conclusion: The target population (under 39 yrs.) is represented by 80% of callers. An increased awarness of service by 1) non-English speaking, low literacy, injection drug use and gay/bisexual population is needed. Expanding the Hotline's awarness of AIDS and related services will be essential.

E.570 COOPERATIVE LEARNING WITH TEAM PACKS, A ROLE PLAYING PROGRAM FOR AIDS EDUCATION OF ADOLESCENTS

Bentrup, K.L., Lee D.D., Rienzo, B.A., Dorman, S.M., JOHNSON, Michael P.*, and Small, Jr., P.A., Center for Cooperative Learning, University of Florida, Gainesville, Florida, USA.

Objective. To measure the effectiveness of TEAM PACKS, a self-contained printed role playing program for AIDS education of 14 to 17 year old high school students.
Methods. TEAM PACKS provide factual information and direct students, in groups of four with minimal teacher supervision, through a role playing scenario about HIV infection. Randomized health classes, received; (A) the TEAM PACK, (B) a lecture with matched content, (C) the TEAM PACK and the lecture, or (D) neither intervention. Pre and post tests assessed knowledge and attitudes about AIDS.
Results. Knowledge was significantly improved by each of the three interventions (A,B, or C), as compared to controls (D), attitudes were improved by the combination of TEAM PACK and lecture (see table).

	KNOWLEDGE				ATTITUDE			
	A	B	C	D	A	B	C	D
N	67	64	71	72	67	64	71	72
%*	41.9+	29.0+	42.7+	9.5	10.2	10.6	20.4+	11.8

*=% of maximum possible improvement; +=different from control at $p<0.05$.
Conclusion. TEAM PACK, like the lecture, increases cognitive gain. The active involvement of students, promoted by the TEAM PACK, was essential to effect an attitudinal change. Additional TEAM PACKS dealing with other sexually transmitted diseases should increase the attitudinal change. Whether they will lead to behavioral change will require further study.

E.571 MASHIGO AIDS GAME: DESIGNED AND CREATED BY MR ASHLEY MASHIGO

Knobel, Gideon J.
University of Cape Town, South Africa

Objective and aims: to be simple and informative; to create awareness and educate even semi-literate persons about AIDS and prevention in a spirit of competitiveness, the reward being to become "The Grand Master of HEALTH"; to change attitudes and behaviour; to create understanding of other religions and traditional beliefs; to create a global spirit of goodwill and cooperation.
Methods: Based on existing tribal games already known in rural and urban areas it was designed to be played in four different ways:

i) for the very young player: a very simplified version of draughts;
ii) for older children a version of snakes and ladders with rewards or admonishment for answering questions correctly or wrongly;
iii) for sexually active people a more complicated chess-like game;
iv) for the general public a game with questions like trivial pursuit.

The board design is a variation of a traditional chess board, with 16 pieces consisting of a Hospital, Doctors, Nurses, Warriors (sexually active person or drug pushers hunting to conquer sexual partners or drug users), AIDS viruses (carriers) and Blood (potentially infected). All four variations can be played by the "captains" of opposing teams on a life-size mat with children as draught pieces. A "referee", for example the Biology Teacher or Health Sister, encourages players and onlookers to discuss aspects of the disease and argue against decisions in order to share and improve knowledge. After educational lectures self-study is encouraged from handouts and library references aiming at inter-school competitions.
Results: Enthusiastic response from audiences in limited trials.

E.572 AIDS INFORMATION THROUGH CITY WATERBILL DELIVERY IN HOUSTON, TEXAS, USA

Falletti, Robert L.; Bridgewater, S.; Smith, G. and Shannon, J.
Bureau of Epidemiology, Houston Dept. of Health and Human Services, Houston, Texas, USA

Objective: How to provide written AIDS information in a simple, cost-effective way, to 400,000 people, and in the process, promote other agencies to do the same.
Methods: The City of Houston Public Works Department provides public information on various topics through billing inserts. In order to utilize this distribution method, a question and answer insert was prepared with the most commonly asked questions about AIDS. This insert was written in both English and Spanish at a level of understanding equivalent to eighth-grade reading skills.
Results: In the months of September and October 1987, the AIDS information inserts were included in over 400,000 City waterbills. This was the first mass mailing of AIDS information by the City of Houston to its citizenry. The total cost for this project was $12,518, for typesetting and printing. No additional postage was required to include this insert.
Conclusion: Other agencies are now interested in trying what the City of Houston has initiated, including Southwestern Bell, Houston Lighting and Power, and Entex Gas Co.

Special thanks to James G. Haughton, M.D., M.P.H., former director of Public Health, and George Greanias, City Councilmember, for their direction, support and interest.

E.573

E.574

THE ROLE OF AIDS HOTLINES IN A DEVELOPING COUNTRY: RESULTS FROM THE NATIONAL AIDS HOTLINE OF TRINIDAD AND TOBAGO

Helquist, Michael*; Duke, B.**; Joseph, H.**; Narain, J.***,
*AIDSCOM, Washington D.C.; ** Ministry of Health, Trinidad and Tobago; *** Caribbean Epidemiology Centre, Trinidad and Tobago,

Objective. To determine the effectiveness of AIDS information hotlines in dissemination HIV prevention messages and in collecting knowledge, attitudes, and behavior data. To develop a pilot program relevant to use in other Caribbean countries.
Methods. Feasibility studies were conducted assess the usefulness of a National AIDS Hotline. Key informant interviews were used to help shape the hotline services. A pilot operations guide was developed, monitored, and evaluated. Data collection forms were designed and evaluated. Sub-samples of callers provided in-depth information regarding AIDS knowledge, attitudes and behaviors. A cost-effectiveness analysis of the service has also been developed.
Results. The national hotline has become a model program, including instruments to test feasibility, design and operational needs, data collection methods, usefulness of hotlines as a means of collecting information, and cost effectiveness. Early data indicate popularity of the hotline. Calls increased by 36% after the first two weeks of service. Callers indicate confusion about the meaning of HIV infection and a desire for more information about HIV antibody testing.
Conclusion. A hotline can be effective in disseminating and collecting AIDS prevention information in a developing country. Data collected can help shape prevention messages in national campaigns and can help direct targeted intervention efforts.

E.575

TRAIN-THE-TRAINER MODEL PROGRAM FOR DEVELOPMENT OF AIDS HOTLINES IN THE ENGLISH-SPEAKING CARIBBEAN

Helquist, Michael*; Joseph, H.**; Stein, J.*; Saunders, S.*; Duke, B.***; Ducasse, M.****.
*AIDSCOM, Washington, D.C.; ** National AIDS Hotline Coordinator, Trinidad and Tobago; *** National AIDS Committee, Trinidad and Tobago; **** Ministry of Health, Jamaica.

Objective. To develop a Caribbean-specific model training information hotline service.
Methods. Experts from English-speaking Caribbean nations joined communications specialists from the U.S. to design, test, implement, evaluate, and refine a model train-the-trainer program for AIDS hotline coordinators and volunteers.
Results. A five-day train-the trainer workshop model was developed and implemented with Caribbean AIDS educators. the model was later tested and evaluated in the field. A 100 page training guide was developed and distributed: samples will be available. The guide helped direct the implementation of AIDS hotline programs in Trinidad and Tobago and in Jamaica. These programs will serve examples for other interested countries in the Caribbean region. Date from the two national programs will be presented as well.
Conclusion. A train-the-trainer model similar to those developed for use in the U.S. can be modified to be relevant to English-speaking nations in the Caribbean. The model can successfully direct the development of national hotline services in developing countries.

E.576

MODEL AIDS HOTLINE TRAINING PROGRAM: MODIFYING THE U.S. COMMUNITY-BASED ORGANIZATION EXPERIENCE TO THE CARIBBEAN

Saunder, Susan G.*; Helquist, M.*; Stein, J.*; Joseph, H.**; Duke, B.***; Ducasse, M.****
*AIDSCOM Project, The Academy for Educational Development, Washington, D.C.; **National AIDS Hotline Coordinator, Trinidad and Tobago; *** National AIDS Committee, Trinidad and Tobago; ****Ministry of Health, Jamaica.

Objective. To develop a hotline training model based on the community-based organization model of the United States for national AIDS Programs in several Latin American and Caribbean countries.
Methods. Design and pilot test a modular training program focusing on the goals, development, operation, and management of a volunteer operated AIDS Hotline. Training methodology focused on experiential and observational training techniques and instructional design. The training modules and materials were pilot tested in a U.S.-based workshop with representatives from two Caribbean countries Trinidad and Tobago and Jamaica.
Results: A 5 day train the trainer workshop model was developed and implemented with Caribbean AIDS educators. The model was later tested and evaluated in the field. A 100 page training guide was developed and distributed which is being used to help direct the implementation of the AIDS hotlines in Trinidad and Tobago and in Jamaica. This program is serving as a model for other Caribbean programs as well.
Conclusion. The U.S. model can be adapted for English speaking nations in the Caribbean. This model can successfully direct the development of national hotline services in developing countries.

E.577

AIDS: HUMAN RIGHTS AND PUBLIC HEALTH: THE SEARCH FOR APPROPRIATE RESPONSES

Philip L. Bryden Faculty of Law University of British Columbia Vancouver, B.C. Canada V6T 1W5

The need to protect AIDS victims from unjustified discrimination is growing. In developing the means to so protect these individuals, a balance must be struck between the rights of those suffering from the disease and the needs of public health officials in controlling the spread of the disease.

The recognition of the rights of HIV sufferers reflects our commitment to fairness and could be important in the public health effort to control the spread of AIDS.

A key feature in the public health effort to control the spread of the disease is the use of public education programmes. An impediment to the success of such programmes, however, is the reluctance of those at whom they are aimed to identify themselves as carriers of the disease.

Human rights legislation can ease disincentives to HIV sufferers to identify themselves by minimizing the social consequences that can flow from the fear of AIDS.

In developing such legislation, however, the rights of AIDS victims must be balanced against the need for reasonable preventitive measures. Although AIDS discrimination would be justified in only the rare case, even measures with an element of coercion could be justified if they did not infringe unduly on the rights of AIDS victims.

E.578

E.579

INTÉGRATION DES ENFANTS ATTEINTS DE VIH DANS LES CENTRES COLLECTIFS INFANTILES (GARDERIES ET ÉCOLES)

Echeverría,Ascal.*; Urturi,M.*;Aristegui,J.**; Gutierrez,C.*; Delgado,A**; Rulcion,D.*.
* Servicio Vasco de Salud.Osakidetza, ** Universidad del Pais Vasco,Pais Vasco.España.

Objectifs. Etablir un programe pour l' intégration des enfants atteints d'infection VIH dans les garderies et les écoles.
Méthodes: INFORMATION: á la Direction du Centre et au professeur responsable de l'enfant de:a) la situation actuelle de l'infection VIH;b) l' état clinique de l' enfant atteint qui va entrer dans le centre collectif infantile. REUNIONS périodiques de l'équipe de santé avec les personnes responsables de chaque centre et réunions trimestrielles avec tous les centres impliqués. CONFIDENCIALITE: Il est demandé la plus grande discrétion devant le reste du personnel du centre et devant les parents des autres élèves.
Resultats: Durant les années scolaires 1987-88 et 88-89, 11 enfants VIH(+), âgés de 2 á 4 ans et en état clinique P_2A (CDC), ont été admis dans des collectifs scolaires.
Nous avons pu observer un net progrès dans l'attitude, la connaissance du sujet et l'attention á ces enfants VIH(+) de la part du personnel des centres scolaires ou des garderies.
L'adaptation de ces enfants a été normale dans tous les cas.
La communication à la direction du centre et à la persone responsable, avant l'entrée de l'enfant dans ledit centre, de sa séro-positivité a été le facteur clef de l'intégration normale de celui-ci.
Conclusions: Nous considérérons d'une importance capitale la communication au Centre (Directeur, professeur responsable) de la séro-positivité au Ac VIH d'un enfant avant son entrée dans l'établissement.
Les réunions périodiques de l'équipe de santé avec les responsables du Centre ont été très utiles pour tracer les modèles d'action.

E.580

PERCEPTIONS ABOUT PERINATAL AIDS TRANSMISSION AMONG DOMINICAN ADOLESCENTS: KNOWLEDGE AND EMPOWERMENT

Dyke, A.; Kreniske, John.
HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute, New York, New York, U.S.A.

Objectives: Among adolescents in the Dominican Republic, to determine the barriers that must be overcome in order to make effective, a preventive program that emphasizes perinatal transmission of AIDS.
Methods: A series of 30 interviews, individual or small group, among 60 persons (36 scholars or students), documents the perceived connexions between condom use, HIV transmission, and perinatal transmission of AIDS.
Results: These were the barriers encountered:
1. Few people mentioned, or appreciated, the role of perinatal transmission.
2. People did not feel themselves at risk. Some expressed disbelief about the presence of AIDS in their country; many considered it a disease confined to homosexual men, Haitians and sex workers.
3. There was considerable objection to using condoms, and many doubted their efficacy in prevention.
4. Mutual monogamy was emphasized; at the same time there was a widely recognized impression that men were "macho," and not monogamous.
Conclusions: Economic resources (which seem not easily available) are required to mount an intensive educational campaign to overcome these barriers. These resources will compete for priority with other recognized health, social and educational needs.

E.581

LEVEL OF KNOWLEDGE REGARDING TRANSMISSION OF THE AIDS VIRUS IN A SAMPLE OF HIGH SCHOOL ADOLESCENTS

Kasen, Stephanie; Walter, H.J.; Gladis, M.; Gutterman, E.M.; Michels, J.L.; Vaughan, R.D. and Ehrhardt, A.A. HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute & Columbia University, New York, New York, USA

Objective: To describe and compare the level of knowledge regarding casual, IV drug, sexual, blood transfusion, and prenatal transmission of the AIDS virus in an adolescent sample (N = 250).
Method: A comprehensive close-ended questionnaire measuring knowledge, attitudes, and behaviors related to the nature, cause, transmission, and prevention of AIDS was developed and administered during one 45 minute class period in 10 tenth grade classrooms in two suburban high schools.
Results: Preliminary data on 111 students indicate that over 80% of the sample are well informed about IV drug, sexual and prenatal transmission of AIDS. However, students were less well informed about casual transmission and transmission through blood transfusions, with item scores falling to less than 60% correct. Item analysis indicates that all items discriminate well in the expected direction between students scoring high and low in overall knowledge.
Conclusions: Even in a middle class high school system that has implemented a mandatory AIDS education curriculum, students manifest marked deficiencies in knowledge of specific areas of AIDS transmission, and show great variability in overall knowledge. This indicates that AIDS prevention education programs need to be tailored to meet the needs of specific student populations, and to focus more on areas such as casual transmission which have major implications for the stigmatization of AIDS victims.

E.582

HIV EDUCATION IN A PUBLIC PSYCHIATRIC SYSTEM

Martin, Rita*; Bennett, M.*, Jacoby, V.*, Passikoff, N.*; James, D.**; Wrobleski, S.:***.
*Department of Mental Health, Boston, MA, USA, **AIDS Action Committee, Boston, MA, USA, ***JSI, Boston, MA, USA.

Objective: To demonstrate the effectiveness of small group process in two "train the trainors" models for HIV education in public psychiatric systems.
Methods: To compare and contrast two train the trainer models of HIV education to public psychiatric employees. In the first model didactic training was the primary method of education. In the second model didactic training was interspersed with small group process.
Results: As measured by evaluations and observation of training participants, the training method that includes small group process, was more favorable than those received for the strictly didactic training.
Conclusion: The more effective method of imparting information to mental health professionals concerning HIV is a curriculum that relies on group process to facilitate the reduction of fear and anxiety associated with AIDS.

E.583

AIDS EDUCATION FOR FIRST YEAR MEDICAL STUDENTS: A QUASI-EXPERIMENTAL STUDY IN KNOWLEDGE AND ATTITUDE DEVELOPMENT AND RETENTION INVOLVING THREE TEACHING METHODOLOGIES

Carroll, Jamell L, Wolpe, P.R.,U.S.A.

Objective: To examine the relationships between AIDS educational methodologies and the development and retention of knowledge and attitudes in first year medical students.
Method: Randomized Pre-post Test Control Group Design utilizing 114 first year medical students from a large urban medical center. A total of six groups were given AIDS education. Two groups received either an experiential, didactic, or audio-visual educational format, while two control groups received no AIDS education.
Results: Data analysis revealed that there were no significant differences in AIDS knowledge or attitude scores with respect to teaching methodology. However, when attitudinal questions were analyzed separately, there were several significant differences in reported comfort levels in working with persons with AIDS. These results indicate that certain teaching methods may be more effective for teaching about AIDS, but that the most effective strategy would be to combine teaching methods. Qualitative data revealed that medical students are feeling afraid and uncomfortable about working with persons with AIDS and that they have a difficult time discussing their feelings.
Conclusions: Much more work is necessary in the area of AIDS education. There is no comprehensive data on how medical students are being prepared to work in the current AIDS epidemic. This study sheds light on this area.

E.584

"CANADIAN ADOLESCENTS AND AIDS: A SURVEY OF KNOWLEDGE AND ATTITUDES ABOUT AIDS AMONG TEENAGERS VOLUNTEERING IN TORONTO HOSPITALS"

Lefebvre, Arlette; Read, S.E.; Collins, E.; Hogan, T.; Snyder, N.
University of Toronto, Toronto, Ontario, Canada.

Objective: This study examines the impact of mandatory AIDS education initiated in Ontario Schools during the fall of 1987.
Methods: One hundred and eighty students - 135 females, 45 males, mean age 16.3 years - working as volunteers in 13 Toronto area hospitals were surveyed during the summer, in terms of 1) General Health Knowledge, 2) Knowledge about HIV infection, 3) Attitudes towards persons with AIDS and safe sex practices, using both open ended and multiple choice questionnaires.
Results: Knowledge about HIV, but not Attitudes, was found to correlate positively with general health scores. The only variables to correlate significantly with attitude scores were sex ($p<0.00$[illegible]) and sociocultural background ($p=0.005$) with females and children of Canadian, American and European backgrounds being significantly more positive in their attitudes towards safe sex and persons with AIDS than males and children of Asiatic or Third World countries. Approaching significance were the trends for children of highly educated parents (especially health professionals) to be more negative than children whose parents had not completed high school.
Conclusion: Increased knowledge about HIV does not necessarily guarantee positive attitudinal changes.

E.585

DO SEXUAL PRACTICES IN UNIVERSITY STUDENTS JUSTIFY THE PROMOTION OF CONDOM USE?

Izazola Antonio*, Mondragón M*, Valdespino JL*, Sepúlveda J*, Townsend J.**

*Directorate of Epidemiology, Ministry of Health, MEXICO. **Population Council MEXICO

Objective: To describe sexual practices, and knowledge and use of condom in Mexican university students.
Methods: A survey to determine sexual practices regarding the risk of AIDS transmission was carried out in university students in three cities, 2 touristic resorts and one USA border city. The information was obtained through a questionnaire. 473 men and 430 women were interviewed.
Results: The main results are presented in the following tables.

SEXUAL ACTIVITY

	MALE	FEMALE	P
AGE (Average)	22	21	NS
Sexually active	43%	11%	<.001
Homosexual practices	3.5%	0.5%	NS
Partners (average in the last 6 months)	1.8	0.8	<.001

KNOWLEDGE AND CONDOM USE IN SEXUALLY ACTIVE

	MALE	FEMALE	P
Knows condoms	49%	38%	<.001
Ever used one	59%	57%	NS
Purpose of use:			
Family planning	38%	47%	NS
AIDS prevention	1%	0%	NS

Conclusion.- Contrary to expectations prevalent sexual practices in university students justify educative interventions to promote condom use, although it may thought that Latinamerican students have less risky practices than students living in industrialized countries. Condom use is now associated to family planning.

E.587

AIDS KNOWLEDGE AND SOURCES OF INFORMATION ABOUT AIDS AMONG IV DRUG USERS

McCoy, H. Virginia*; McCoy, C.B.**; Chitwood, D.D.**; and Trapido, E.J.**; and McKay, C.Y.** *Florida International University, Miami, FL, USA, **University of Miami School of Medicine, Miami, FL, USA.

Objective. To describe the distribution by sex and ethnicity/race of sources of AIDS information and to determine the effect of the source of information on AIDS knowledge among IVDUs.
Method. As part of a study which tests two interventions to reduce AIDS among IVDUs, 346 subjects were recruited from drug networks and interviewed. Bivariate analyses were conducted to assess the distribution of information sources and the relationship to AIDS knowledge. Gamma values assess the strength of relationships.
Results. Print media was the most likely source of AIDS information used by IVDUs. Information source varied, however, by ethnicity/race and sex and was statistically significant. Each source (TV/Radio, print, institutions, persons) was more likely to be the choice of a particular ethnic/racial group. The source of information was also related to the accuracy of knowledge about AIDS. Those who obtain information from individual persons, such as outreach workers and friends, score higher on a knowledge test.
Conclusion. Communications about AIDS should be ethnic/race-specific and sex specific using particular media for each group.

E.589

POST-TEST IMPROVEMENT IN AIDS KNOWLEDGE SCORES AMONG INTRAVENOUS DRUG USERS (IVDU) IN A PRISON-BASED AIDS EDUCATION PROGRAM

Selwyn,Peter A; Pericles,MK; Lipshutz,C; Cox,CP; Cohen RL.
Montefiore Medical Center/Albert Einstein College of Medicine, Bronx, NY, USA.

Objective. To assess the impact of an educational program on AIDS knowledge among incarcerated IVDU's in a New York City detention facility.
Methods. Newly arrested male IVDU's were offered a five-session small group AIDS education program as part of a pilot project in 1985-86. Formats included didactic sessions, role-playing, and printed materials. Participants took self-administered seventeen-item true/false pre- and post-tests. Pre- and post-test scores were compared overall, for individual items, and by sociodemographic variables.
Results. Pre- and post-test results were available for 104 inmates, of whom 47(45%) were black, 46(44%) Hispanic, and 11(11%) white; mean age was 31.7 yrs.; 84(81%) had secondary school education or less. Mean percent correct for pre-test was 76%, vs. 89% for post-test (P<.01), with no significant differences in improvement by race, education, or age. Pre-and post-test scores were both >90% correct for items concerning risks of needle-sharing, heterosexual contact, and perinatal transmission of HIV. Significant post-test improvement (P<.05, McNemar's test) was seen for items concerning condom efficacy, needle hygiene, perceived risks of casual contact, and certain medical aspects of AIDS.
Conclusion. Results indicate significant post-test improvement in AIDS knowledge scores among incarcerated IVDU's participating in a prison-based AIDS education program, especially regarding prevention behaviors and popular misconceptions about AIDS. Pre-test knowledge was high regarding certain aspects of drug and heterosexual transmission. Data suggest that prisons may be strategic sites for targeting AIDS education programs for IVDU's, combined with strategies to promote behavior change.

E.586

AIDS EDUCATION OF DRUG ADDICTS

Sorrell, S.*, Elion, R.**
*St. Luke's/Roosevelt Hospital Center, New York, N.Y., USA
**Montefiore Medical Center, Bronx, New York, USA
*Presenter

The strategy of risk reduction in substance abusers is dependent on the stage of awareness and recovery of the population. We have shown that the techniques used with a population in methadone maintenance, while similar in some respects to the techniques used within therapeutic communities are markedly different from the population not currently engaged in treatment. The use of didactic materials and audiovisual devices are effective in both treatment settings. One significant difference between the techniques implied in the methadone programs is the need for the timing of education intervention at or before the administration of medication, while the therapeutic community allows more latitude in the scheduling of the same interventions.

This should be contrasted with the needs of the street based interventions that by necessity must be much briefer in duration and be addressed to an immediate interest of the user on the street, such as bleach to clean their works, or a condom "to protect themselves." This intervention is further distinguished by the need to recognize what phase of drug acquisition and intoxication is being displayed by the client.

Notwithstanding the above differences, the similarities of tailoring the materials in a upbeat, non-judgemental fashion in appropriate language to the audience is paramount in importance. We will present examples of the above interventions in our presentation.

E.588

REACHING HIGH-RISK YOUTH: TRAINING THE PROVIDER

Drooker, Nancy*;Doctor, L.**;Rosenfeld,S.***,Breen,R.****
*Planned Parenthood, Cambridge, MA,USA,**Mass. Dept. of Health(DPH),Substance Abuse Services,***DPH AIDS program, and ****DPH Addictions and Health Research

Objective: To describe the outcome of a two day intensive training on increasing AIDS knowledge, comfort and skill level in providers working with high-risk youth.
Methods: Three regional trainings for a total of 80 youth intervention program staff took place in the spring of 1988. Youth intervention programs are designed to provide outreach and early intervention services to youth identified with alcohol and drug related problems. The program was planned and implemented with the collaboration of the Dept. of Public Health, Planned Parenthood, community-based agencies and people with AIDS. A safe environment was created by skilled trainers. Role modeling, affective and didactic methods were used. Participants were exposed to issues faced by gay, black and latino youth from the perspective of members of these communities. Pre, post and follow-up questionnaires were used to measure change in knowledge, comfort and delivery of service.
Results/Conclusion: Preliminary results show significant increase in understanding of AIDS information, in comfort and skill level in addressing issues of sexuality and in comfort and skill level in educating high-risk youth about AIDS and AIDS prevention. Follow-up surveys indicate participants are using the risk reduction and prevention strategies developed during the training.

E.590

A COMPARISON OF STUDENTS', TEACHERS', AND SCHOOL BOARD PRESIDENTS' KNOWLEDGE AND ATTITUDES ABOUT AIDS

Huszti, H.C.*; Ambuel, B.**; Johnson, J.*; Mullins, L.L.*; and Mason, P.J.*.
*University of Oklahoma Health Sciences Center, Oklahoma City, OK, USA,
**Case Western Reserve University, Cleveland, OH, USA.

Objective. To determine the level of knowledge about AIDS and attitudes towards persons with AIDS (PWAs) of high school students, teachers, and school board presidents. As more children with AIDS attend public schools, it is important for those who allow children entrance (school board), teachers working with the children, and their peers to have accurate knowledge about AIDS and positive attitudes towards PWAs. In order to design programs to counteract negative public attitudes towards AIDS, it is important to first determine what those misconceptions are. This study explores the knowledge and attitudes of these three groups.
Methods. A previously used knowledge and attitude questionnaire was administered to 10th grade students (n=448), school teachers (n=224), and school board presidents (n=190). The form contained questions about the risk of casual contagion, the meaning of the results of antibody testing, and modes of transmission. The form also contained questions about the subjects' attitudes towards social interactions with PWAs, level of discomfort around PWAs, and whether PWAs should attend public school.
Results. Data will be presented on the three groups' relative knowledge about AIDS and attitudes towards AIDS.
Conclusions. Differences between the groups will be highlighted. Recommendations for educational programs will be made.

E.591

TRAVAIL EDUCATIF QUI A REALISER À CÔTE DE LA SOCIETÉ CIVIL.

Meren, Janete Luzia Leite ; Moura, E.M.M. et Morais de Sá, C.A.
Hospital Universitário Gaffrée e Guinle - UNI-RIO - Brésil

OBJECTIFS:
1. Rapporter l'experience éducatif/informatif du Service Sociale sur les questions sociaux que enveloppent le SIDA par la societé civil.
2. Analiser les résultats obtenus.

MÉTHODE: L'étude a eté realiser dans le Municipe du Rio de Janeiro par deux assistents sociales qui ont conférences sour les conséquences sociaux de le SIDA, avec une fréquence relative de 40 persones pour conférence. L'evaluation de l'extension de l'information a eté realiser à partir de questionnements envoyées à les acteurs pendent la conférence; totalizant 50 conférences.

RÉSULTATS: A eue une moyenne de 5 questionnements pour conférence, dont les thèmes plus fréquents ont:

	%
Demission de persones seropositifs et/ou avec le SIDA	100
Préjugé avec homossexuels	30
Le control du sang au Brésil	30
Organisations non-gouvernementales existents	50
Discrimination par la personne qui porte le HIV	62
Travail realisé pour le Service Social dans l'Hôpital	73

CONCLUSION: On observé un grand intérêt pour les conséquences sociaux de le SIDA, et par le travail realisé pour le Service Social, principalment entre les jeunesses.L'experience a demonstrer que le professionel du Service Social commence a être compris et accepté comme détecteur de connaissances et functions especifiques à côte de la societé en general.

E.592

THE MOBILISATION PROJECT OF THE SOCIAL SERVICES IN GOTHENBURG,

Sonnergård, Ulla,SWEDEN

Objective. The objective of the project has been to create a greater awareness of HIV/AIDS and to disseminate in-depth knowledge to the staff.
Methods. 1. The project has been carried out on two fronts: to create an organisation that would facilitate basic information and knowledge to reach all employees in short time. A special network of representatives has been established of different district- and activity-related groups. 2. to increase the level of knowledge at the beginning of the project, lectures of facts about HIV/AIDS were held - one-way-communication. The change of values and attitudes required special in-depth education in small working-groups - two-way-communication. In order to change behaviour we used small highly motivated working groups.
Results. The organisation of the project has made it possible for the employees to increase the knowledge and awareness of HIV/AIDS in a short time and to create channels for quick and continous information.
Conclusion. This model has prooved suitable for giving information about HIV/AIDS to employees (aprox. 15.000) in a city of 1/2 million inhabitants. It can also be used by smaller cities/communities in cooperation.

E.593

PUBLIC HEALTH STAFF AND COMMUNITY HIV EDUCATION THROUGH A PERIODIC NEWSLETTER

Mindell, William and Sinuk, V.
City of Toronto Department of Public Health, Toronto, Ontario, Canada.

Objective. To summarize for public health staff and others the scientific basis for public health responses to common questions on AIDS.
Methods. A periodic 2-3 page newsletter called AIDS This Week (ATW) was initiated in July 1987 and issued every 1-3 weeks. ATW deals with a single issue or question, or reports on a single scientific paper. Concise conclusions and recommendations for staff to pass on to the public are included.
Results. In July 1987 the City of Toronto committed a portion of work of all 650 public health staff to HIV education in a 30-month AIDS Operational Plan. In addition, over 80 new staff were hired exclusively to deal with AIDS education and prevention. ATW was developed to support these staff and focused on common questions including HIV risk from a human bite, the risks associated with fellatio, the relationship between HIV transmission and head lice, and the safety of the blood supply. By January 1989, 34 issues had been produced and distributed to 449 DPH staff, community agencies, public health units and international AIDS organizations. A recent evaluation yielded 250 responses for a response rate of 56%. Eighty-three percent of respondents posted or circulated copies to their staff, 34% reproduced and distributed copies regularly, and 17% had quoted ATW for other publications. Ninety-eight percent indicated they found the recommendations helpful and 92% indicated they had learned something new about HIV.
Conclusion. A science-based periodic publication on high-interest issues in a simple format will be well received and helpful to staff and other groups concerned with answering the public's questions about AIDS.

E.594

AN EXPERIENTIAL METHOD OF EDUCATING HEALTH CARE PROFESSIONALS ABOUT PATIENTS' REACTIONS TO NEUROPSYCHOLOGICAL ASSESSMENT

Grace, William C., and the Walter Reed Retrovirus Research Group, Walter Reed Army Medical Center, Washington, D.C., United States of America

Neuropsychological assessment is geared toward delineating the cognitive capacities of a patient, and it has generally (but not always) been used with patients whose condition has clear neurological sequelae, such as cerebrovascular accident or head injury. HIV patients are now frequently referred for such assessment, but neither they nor their health care professionals may have a clear understanding of the processes involved in assessment. A method for helping health care professionals experience for themself the defenses and reactions of patients undergoing assessment is presented. By using a brief experimental task from developmental psychological studies, normal adults can be induced to experience and examine their defenses to unfavorable neuropsychological feedback. The experiences of the author in using this technique in teaching approximately 100 professional staff who work with HIV patients are discussed, and ideas for further application of this teaching technique are presented.

E.595

A STUDY OF DRUG TREATMENT STAFF ATTITUDES AND EDUCATIONAL NEEDS PERTAINING TO AIDS.

Margaret M. Connors, J.P. Russo, L.A. Baker, B.F. Lewis, Spectrum House,Inc.
155 Oak St., Westboro, MA 01581, U.S.A.

Objective: To determine knowledge, anxiety level and attitudes of staff at a drug treatment facility to accommodate needs for AIDS education.
Methods: In November 1987 and July 1986, the Research staff at Spectrum House, Inc., anonymously surveyed administrative, counseling, medical and support staff. Frequencies, cross-tabulations, and multiple regression analysis were used.
Results: Most (93%) respondents (N=61) have social contact with HIV+ clients at least once/week. Despite on-going AIDS education and an increase in self-rated knowledge over 14 months, one quarter of staff relayed various modes of casual transmission as applicable to HIV. While the majority (92%) of staff know their risk for acquiring AIDS through their work is not likely, 40% feel anxious about being infected while at work. A correlation (p≤05) was found for those who had little or no social contact with HIV+ clients and those who had a disinclination to work with HIV+ clients.
Conclusions: Knowledge that one is at low-risk does not necessarily erase the occupational "fear" of infection. Training for staff needs to occur on a continual basis to reinforce accurate knowledge of risks, update information, encourage expression of anxiety and provide support.

E.596

AIDS EDUCATION FOR NURSING STUDENTS: DOES IT MAKE A DIFFERENCE?

Calder, Barbara*, Brown, Y.*, Rae, D.*
*University of Saskatchewan, Saskatoon, Saskatchewan, Canada. S7N 0W0

Objective: To determine if increased knowledge changes nursing students' attitudes towards AIDS patients.
Methods: The design used in this study was pre test, post test. A questionnaire, developed and validated in the United States, and adapted for use in this study, was administered to the total population of first to fourth year baccalaureate undergraduate nursing students attending a one day AIDS workshop. Questions dealt with knowledge and fears concerning AIDS and caring for AIDS patients, and attitudes towards homosexuality and towards the terminally ill.
Results: Post test results indicated that all groups of students displayed a knowledge gain, a more positive attitude towards caring for AIDS patients (particularily by first and third year students). Although positive, younger students, married students, and students who had cared for AIDS patients were less positive. The level of significance was set at p .05.
Conclusion: In this study, AIDS education had a positive influence on attitudes of nursing students. This finding supports the use of education to foster positive attitudes towards AIDS and AIDS patients.

E.597

CORRECT CONDOM USE ASSESSMENT: AN INNOVATIVE TRAINING MODEL FOR HEALTH CARE PROVIDERS AND AIDS EDUCATORS

Helquist, Michael*; Stein, J.*; Smith, W.*
* AIDSCOM, Washington, D.C., U.S.A.

Objective. To develop, implement, and evaluate a curriculum module to train health care providers and AIDS educators to use an innovative approach to teach correct condom use among people at risk for AIDS.
Methods. A pilot project was developed and tested among focus groups using a protocol that guided a standard observation and assessment of study subjects' use of condoms. A companion survey elicited specific information about knowledge, attitudes and practices related to condom use. Based on these efforts, a training curriculum module was developed to disseminate this intervention through a train-the-trainer approach. The curriculum was presented and evaluated in the field; refinements followed. Sample copies of the curriculum will be available.
Results. Health care providers in the United States, the English-speaking Caribbean, and in the Dominican Republic have been receptive to use of the training module in their own settings. Evaluations from professionals and their clients will be presented.
Conclusion. Use of an innovative protocol for assessment of clients' correct use of condoms has proven to be an effective means for determining public attitudes and skills regarding condoms for AIDS prevention. The intervention also provides direct and effective training to clients about condom use.

E.598

NURSES EDUCATIONAL NEEDS AND ANXIETY LEVELS IN A LARGE LONDON TEACHING HOSPITAL.

Vearnals Simon; Kocsis A; Church J.

Psychology Dept. St. Mary's Hospital, London, U.K.

Objective: 1. To determine the efficacy of HIV/AIDS education for nurses. 2. To provide baseline data on knowledge, attitudes and anxieties for future planning.
Method: A 3 page questionnaire was circulated to N=200 qualified nursing staff at a large London Teaching Hospital. It comprised 29 basic knowledge questions about HIV/AIDS and a number of questiojs to look at nurses' anxieties and stress levels when caring for people with HIV infection.
Results: 100 (50%), 85 female, 15 male with mean age 28 yrs from a wide selection of departments throughout the hospital (Medical, Surgical, A&E, Intensive Care and Paediatrics) completed and returned the questionnaires. On the 29 basic knowledge questions 80% achieved fewer than 20 correct. 82% of nurses received training/education about HIV/AIDS, only 18% received no input. When asked about further input about specific topics, 72% requested basic transmission information and 70% counselling and infection control guidelines. We have found no correlation between levels of knowledge and a) refusal to care for patients with HIV infection, and b) concern when caring for people with HIV infection. Further data is available and will be presented at the conference.
Conclusions: Even nurses find it difficult to extract correct information from educational sessions concerning HIV/AIDs education. Therefor proper evaluation is essential to determine the best formats for nurses' educational needs for the future. One hour HIV/AIDS awareness sessions cannot deal with the many questions that nursing staff have and only relieve anxiety levels for a short period of time. Also it cannot be assumed that education alone cannot affect attitudes to nursing patients with HIV infection.

E.599

DIFFERENTIAL PERCEPTIONS OF PERSONS WITH AIDS BY HEALTH CARE STUDENTS BASED ON PATIENT DEMOGRAPHICS

Ficarrotto, Thomas J.*; Grade, M.*; Bartnof, H.*; Koenig, B.*; and Zegans, L.*
University of California, San Francisco, California, United States.

Objective. The purpose of the present investigation was to determine the degree to which health care students differentially assess whether particular demographic groups have been unjustly victimized by AIDS. If some demographic groups are perceived as being more responsible for contracting AIDS than others, then we should find variation in ratings of victimization contingent upon demographic group. Methods. A total of 113 incoming medical and 118 incoming nursing students were asked to rate the extent to which they agreed/disagreed, with one of six versions of the following statement: "__________ have been unjustly victimized by AIDS." Participants received the statement referring to either children, homosexuals, hemophiliacs, Blacks/Hispanics, women, or drug users. Groups were approximately equivalent in respect to age, professional/personal contact with persons with AIDS, and in composition by sex, race, and proportion of medical/nursing students. Results. Findings from Chi-Square analyses indicated that endorsement of unjust victimization by AIDS is contingent upon the demographic group being rated. The majority of students (82%) agreed with the statement that children have been unjustly victimized by AIDS, followed by homosexuals (65%), hemophiliacs (61%), Blacks and Hispanics (49%), women (27%), and drug users (17%), respectively. Non-white students were substantially more likely than white students to agree that Blacks/Hispanics, hemophiliacs, and drug users have been unjustly victimized by AIDS. Nursing students were substantially more likely than medical students to agree that women, and children have been unjustly victimized by AIDS. Finally, medical students were substantially more likely than nursing students to agree that Blacks and Hispanics, drug users, and hemophiliacs have been unjustly victimized by AIDS. Conclusion. Findings suggest a differential assessment of victimization by AIDS contingent upon the demographic group rated. Blacks/Hispanics, women, and drug users are rated as being least victimized by the disease, whereas children, homosexuals, and hemophiliacs are rated as being the most victimized. It is doubtful whether findings pertaining to homosexuals would be replicated in American medical schools outside of San Francisco, where public intolerance of homosexuality is likely to be greater. Surprisingly, findings pertaining to women might reflect that women have historically been held responsible for aspects of sexuality that become problematic (i.e., STDs, unwanted pregnancy). Consideration must be given, however, as to whether our measure of victimization simply reflects a differential assessment of epidemiological risk, or factors of social prejudice which may influence attributions of blame and responsibility for individual contagion. Results also suggest that educational materials be developed separately for nursing and medical students when sensitizing them to the needs of AIDS patients. Finally, in comparison to whites, non-white students might be more sympathetic, and thus better prepared to manage the needs of minority AIDS patients, as well as those of drug users and hemophiliacs.

E.600

DIFFERENTIAL PERCEPTIONS OF PERSONS WITH AIDS BY HEALTH CARE STUDENTS BASED ON PATIENT DEMOGRAPHICS

Ficarrotto, Thomas J.*; Grade, M.*; Bartnof, H.*; Koenig, B.*; and Zegans, L.* University of California, San Francisco, California, United States

Objective. The purpose of the present investigation was to determine the degree to which health care students differentially assess whether particular demographic groups have been unjustly victimized by AIDS. If some demographic groups are perceived as being more responsible for contracting AIDS than others, then we should find variation in ratings of victimization contingent upon demographic group. Methods. A between-subjects design was employed. A total of 113 incoming medical and 118 incoming nursing students were asked to rate the extent to which they agreed/disagreed, with one of six versions of the following statement: "__________ have been unjustly victimized by AIDS." Participants received the statement referring to either children, homosexuals, hemophiliacs, Blacks/Hispanics, women, or drug users. Groups were approximately equivalent in respect to age, professional/personal contact with persons with AIDS, and in composition by sex, race, and proportion of medical/nursing students. Results. Findings from Chi-Square analyses indicated that endorsement of unjust victimization by AIDS is contingent upon the demographic group being rated. The majority of students (82%) agreed with the statement that children have been unjustly victimized by AIDS, followed by homosexuals (65%), hemophiliacs (61%), Blacks and Hispanics (49%), women (27%), and drug users (17%), respectively. Non-white students were substantially more likely than white students to agree that Blacks/Hispanics, hemophiliacs, and drug users have been unjustly victimized by AIDS. Nursing students were substantially more likely than medical students to agree that women, and children have been unjustly victimized by AIDS. Finally, medical students were substantially more likely than nursing students to agree that Blacks and Hispanics, drug users, and hemophiliacs have been unjustly victimized by AIDS. Conclusion. Findings suggest a differential assessment of victimization by AIDS contingent upon the demographic group rated. Blacks/Hispanics, women, and drug users are rated as being least victimized by the disease, whereas children, homosexuals, and hemophiliacs are rated as being the most victimized. It is doubtful whether findings pertaining to homosexuals would be replicated in American medical schools outside of San Francisco, where public intolerance of homosexuality is likely to be greater. Surprisingly, findings pertaining to women might be a reflection that women have historically been held responsible for aspects of sexuality that become problematic (i.e., STDs, unwanted pregnancy). Consideration must be given, however, as to whether the measure of victimization employed in the study simply reflects a differential assessment of epidemiological risk, or factors of social prejudice which may influence attributions of blame and responsibility for individual contagion.

Results from this study also suggest that educational materials be developed separately for nursing and medical students when sensitizing them to the needs of AIDS patients. Finally, in comparison to whites, non-white students might be more sympathetic, and thus better prepared to manage the needs of minority AIDS patients, as well as that of drug users and hemophiliacs.

E.601

THE CANADIAN DENTAL ASSOCIATION'S RESPONSE TO AIDS

HARDIE JOHN, CANADIAN DENTAL ASSOCIATION,
OTTAWA, ONTARIO, CANADA.

OBJECTIVE To describe the role of a national professional organization in altering the practice of its members in response to the AIDS dilemma.

METHODS A significant outcome of AIDS has been the adoption of universal precautions for infection control. Specific procedures have been advocated for dentistry. The leadership role assumed by the Canadian Dental Association for promoting these new concepts was accomplished via: publications, a speakers and information bureau, a consensus conference, specific recommendations, and a practical information guide. In addition, two surveys of the infection control practices of dentists were performed in 1985 and 1988.

RESULTS The survey results indicated that 70% of the responding dentists in 1988 regularly used gloves compared to less than 10% in 1985. Among the surveyed dentists 75% had been immunized for hepatitis B in 1988 compared to 25% in 1985. Similar results were obtained for other aspects of infection control.

CONCLUSION The education and communication policies adopted by the Canadian Dental Association have had a positive effect upon the infection control practices of its members.

E.602

STAFF MEETINGS AS AN ORGANISATIONAL INTERVENTION ABOUT AIDS.

Perry, L.; Bor, R. and Miller, Riva.
Royal Free Hospital and School of Medicine, London, England.

Objective. To describe a process of using open forums as educational meetings and for interventions for changing conflicting and rigid views about AIDS.
Method. Meetings were held for one hour once a month over a period of 27 months (1986 - 1989). Meetings were open to hospital managers, clinical staff, laboratory staff, researchers, community care workers, administrative staff and lecturers. Some topics covered included: the life-cycle of AIDS/HIV, bereavement, in-patient and community care, AIDS and the family, the 'worried well' and drug trials. Each topic was discussed in relation to AIDS counselling; how it affects what might be said to patients and what issues it might raise for patients and staff.
Results. The meeting was initiated at a time when AIDS services in the district were negligible. Staff at the meetings participated in discussions on issues for patients or themselves, as staff. The meeting was overtly used as an educational meeting but was also used to demonstrate the importance and techniques of AIDS/HIV counselling and to bring a consistent approach to counselling in the district. An interest in AIDS in the district emerged. Services were developed and co-ordinated. Views about AIDS changed over time.
Conclusion. Forums for staff in which there are opportunities for discussion and education are important in the development of a healthy organisational climate. This leads to improved patient services and a consistent approach in the management of AIDS. Ultimately, staff and patient morale is improved.

E.603

A TRAINING APROACH FOR NURSES AND DENTISTS

Rodrigues, L. G. Macêdo*; Matheus, Luiz Antonio**; Vechi, Daizê***
*,**,*** Divisão Nacional de DST/AIDS – Ministério da Saúde – Brazil

The Training unit was set up in 1987 as a professional training, education and consultation service on all aspects of AIDS, and has developed a wide range of courses designed to meet the needs of various professional groups.

Objetive: To envolve health professionals, such nurses, physicians, and dentists in the elaboration of their own instrutional materials.

Methods: 16 health professionals (8 nurses) and 8 (dentists) were intensively trained during 2 months in all technical aspects of HIV infection. The philosophy which includes the holistic and humanistic aspects, was also included in the process. We found that the most effective way to develop awareness and skills is by using participatory groups which encourage participants to share relevants experiences derived from their work situations. The course contans 3 Units. Each one is set up of (1) sequence of activities, (2) guidelines for facilitations and (3) evaluation of performance.

Conclusions: This training approach has been successful in reaching health professionals in primary health care and developing an understanding of who she (he) is, how one fells, thinks, and what she or he does.

E.604

AIDS EDUCATION IN PRIMARY SCHOOLS: THE NEED TO REACH THE INNOCENT

J. K. Nguma, K. Nyamryekunge, National AIDS Control Programme, Tanzania

Objective. To determine knowledge about AIDS and attitudes towards AIDS education in Primary 5-7 in Kagera region, Tanzania.

Findings. A survey of 66 primary 5-7 pupils in Kagera region indicates that about 23% of the pupils have had sexual intercourse. Whereas majority of these pupils are aware of AIDS, their knowledge about transmission appears to be limited. Indeed, there exists a number of misconceptions about AIDS transmission. AIDS education in primary schools was recommended by majority of the pupils.

Conclusion. It is apparent that majority of our primary 5-7 children are still safe from the AIDS epidemic. However, as they start indulging in sexual intercourse, this group may not continue to be safe for too long. The paper calls for an urgent introduction of AIDS education in primary schools within the family life education package.

E.605

A NATIONAL AIDS/HIV TRAINING PROGRAM FOR HEALTHCARE EMPLOYEES IN THE DEPARTMENT OF VETERANS AFFAIRS

Durnan, J. Richard*, Mesler, D.S.*, Sverha, S.* and McCarthy, P.**
*Department of Veterans Affairs, Washington, DC, USA **California Nurses Association, San Francisco, CA, USA

Objective: To meet the challenge of promoting humane patient-care and reducing risk of HIV-infection by rapid development and implementation of an effective AIDS/HIV training program for 194,000 healthcare employees in one of the world's largest national healthcare systems, the Department of Veterans Affairs (DVA).

Methods: Experience showed that caring for persons with AIDS often accentuated inappropriate staff attitudes and behaviors, due to misinformation, fear and ignorance. A unique educational response was needed without delay. DVA physicians, nurses and educators planned and implemented interactive training, based on established principles of adult learning. To train the largest number of staff in the shortest time, a train-the-trainer (TTT) approach was adopted, modifying existing programs and materials.

Results: Collaboration between the DVA and the California Nurses Association (CNA) resulted in training (April 1988) 21 master faculty. Master faculty teams facilitated 15 TTT Workshops (May-September 1988) and trained 391 trainers from 172 DVA Medical Centers in content, interactive teaching strategies and facilitation skills. These trainers are functioning (May 1988-present). Further evaluation will be reported in 1989 and 1990. Trainers are supported by teleconferences and updating of training materials.

Conclusion: Collaboration between clinicians and educaters, and between healthcare institutions with shared goals, can produce AIDS/HIV education that meets specific cognitive, attitudinal and behavioral needs of all categories of healthcare workers. The TTT approach expedites expansion of a quality, system-wide training effort. Trainers verify that skills, strategies and materials provided by this unique program revitalize existing training and reduce trainer stress and "burnout." Interactive learning approaches have proven singularly effective in dealing with anxiety and attitudinal barriers.

E.606

AIDS AND PHYSICIANS. ATTITUDE AND KNOWLEDGE RELATED TO AIDS AND AIDS PATIENTS IN WEST GERMAN DOCTORS NEED IMPROVEMENT.

Jäger Hans, Hammel G.
AIDS Study Group, Schwabinger Krankenhaus, Munich, FRG.

Objective. To describe their personal experience, ways of acquiring AIDS knowledge and education, attitude and clinical competence 200 West German physicians were asked to complete a multiple choice questionnaire.

Methods. One third of participants worked in private practices mainly as general practicioners, two thirds worked in a clinical setting mainly in internal medicine. Mean age was 42 years, 36.2% had had personal experience in treating HIV-infected or AIDS patients.

Results. 27% of the participants wanted to treat more AIDS patients, 35.2% wanted to treat no AIDS patients if they had the choice. Only 1.7% of the study sample was able to correctly answer 4 of 4 multiple choice questions relating to epidemiological and treatment issues. 8.6% correctly answered 3 of these questions.

Conclusion. AIDS knowledge in physicians seems to be acquired on a learning by doing basis. More correct answers were seen in those physicians that had treated more HIV-infected or AIDS patients. Growing numbers of AIDS patients will require a basis of AIDS related clinical competence in every physician. Continuing medical education in West Germany, at least if related to AIDS, needs further intensification and improvement.

E.607

MEDICAL STUDENTS' KNOWLEDGE OF HIV-INFECTION AND AIDS.

Michael M. Kochen*, J. Hasford** and members of the Association of Teachers in General Medicine (Vereinig. d. Hochschullehrer u. Lehrbeauftr. für Allgemeinmed.)
*General Practitioner, **Biometric Center for Therapeutic Studies, Munich/W-Germany.

Objective. To evaluate the knowledge on infection with the Human Immunodeficiency Virus (HIV) and the Acquired Immunodeficiency Syndrome (AIDS) of fourth year medical students in W-Germany.

Methods. We asked all members of the Federal Republic of Germany's Association of Teachers in General Medicine to distribute an anonymous questionnaire to forth year medical students during a normal teaching session. 19 universities (and the University of Vienna/Austria) agreed to participate. After providing some demographic data students had to answer 39 yes/no questions with regard to sexual, blood borne, social and "alternate" transmission of HIV, preventive measures, and clinical development of disease. After returning the questionnaires the correct answers were disclosed and discussed with the students.

Results. 1429 completed questionnaires were returned, 51% from male and 43% from female students (6% gave no information about their sex). 133 Students indicated that they know at least one HIV-infected patient personally (no data from 29%). The analysis of students' answers showed some remarkable deficiencies in "HIV-associated knowledge". 18% thought that oral sex is without risk; 5.8% indicated that condoms make sexual contact completely safe; 9.9% believed that transmission is effectively reduced with the number of sexual partners; 7.7% were convinced that HIV can penetrate the intact skin; 8.8% thought that female to male transmission of HIV has not been definitely proven; 14% said that transmission risk is low in vaginal intercourse; 30% deemed it unnecessary to advise persons from risk groups against donation of blood. That HIV can be transmitted by cough, common use of bath and kitchen, passive anal intercourse only, kissing and mosquitoes was indicated by 11, 9.3, 5.4, 14.2 and 11.3% respectively.

Conclusion. Although not representative for the whole country this study was conducted in 19 of the 25 West German medical schools and comprised a large number of fourth year medical students. The gaps in students' knowledge should motivate universities to reconsider the curricula where HIV-infection plays only a marginal role.

E.608

DIAGNOSING THE DOCTORS: HIV RELATED KNOWLEDGE, ATTITUDES, AND RESOURCE NEEDS OF PHYSICIANS IN THE SOUTH CENTRAL U.S.

Risi, George; Fitzgerald, A; Wright, E; Pejsach M; Marier, R.
Delta Region AIDS Education and Training Center Center, New Orleans, La., U.S.A.

Objectives. To gain information with which to develop a tailored instructional program on AIDS for area physicians.

Methods. A comprehensive needs assessment questionnaire was mailed to a random selection of primary care physicians throughout Louisiana, Arkansas, and Mississippi. Primary topics addressed were provider attitudes, knowledge base, barriers to treatment, and preferred methods of education.

Results. The 113 respondents represented 2.0% of all licensed primary care physicians in the region. A mean of 4 hours/month was spent on HIV related issues. From a list of 12 HIV related issues, prevention techniques in the workplace, followed by modes of transmission, were rated most important. On a 9 point Likert scale physicians were comfortable with their knowledge of risk assessment (6.6), infection control practices (5.9) and diagnosis (5.7), but in an objective measurement of knowledge based on test questions they scored poorly in all these areas. Learning methods that would most likely be used were a professional's telephone hotline, local sessions of 1/2 day or less given by experts, and journals. Methods involving face to face contact with an HIV (+) person were strongly opposed.

Conclusions. In an area of the U.S. where AIDS is not yet epidemic, a lack of understanding of fundamentals prevails, as does inordinate concern over transmission in the professional setting and reluctance to encounter HIV (+) persons. These data help form the basis for an educational program.

E.609

AIDS: DIAGNOSING EDUCATIONAL NEEDS OF HEALTH CARE PROFESSIONALS

Wright, E.; Fitzgerald, A; Risi, George; Marier, R.
Delta Region AIDS Education and Training Center, New Orleans, La., U.S.A.

Objective. To determine health care providers' attitudes toward AIDS education and learning needs in three southern states.
Methods. A written questionnaire was mailed to a random sample of 842 primary care physicians, nurses, infection control practitioners, dentists, dental hygienists and social workers. Additional data was collected from 15 key informant, telephone interviews. AIDS experts in the 3-state region were selected as informants. In addition to statistical analysis of the survey results, the quantitative data was triangulated with qualitative findings from the interview.
Results. An education needs profile within and across professional group categories found that health care professionals and AIDS experts agreed on the importance of AIDS/HIV education but differed on its focus. For example, AIDS experts described the need for learning in the psychosocial dimensions of AIDS treatment. Although survey respondents ranked low their current satisfaction level with these issues, psychosocial concerns were not a priority learning need. Instead, knowledge about prevention techniques and high risk groups and profession-specific skills related to AIDS/HIV treatment were more highly rated. Attitudes toward AIDS/HIV infection differed among professional groups as well as their perceived impact on service quality. Implications for educational programs based on health providers' learning style preferences and perceived educational needs are discussed.

E.611

A CLINICAL PROGRAM TO TRAIN PHYSICIANS AND PHYSICIAN ASSISTANTS TO PROVIDE OUTPATIENT CARE FOR HIV-INFECTED PATIENTS

Katsufrakis, Peter*; Sattler, F.R.**; Gates, J.*; Mertz, S.*; Lee, P.V.*.
AIDS Education and Training Center, *Department of Family Medicine, **Department of Medicine, University of Southern California School of Medicine, Los Angeles, California, USA.

Objective. To provide physicians and PA's with knowledge and skills to manage the complications of HIV infection seen in the outpatient setting, and to increase the numbers of trained primary care providers caring for HIV-infected patients in the community.
Methods. Physicians and PA's from 5 counties in Southern California receive intensive, 1 week, one-on-one clinical training with a physician specialist in a multidisciplinary, university-affiliated AIDS outpatient clinic. The population includes ethnic minorities (40%), indigent (66%), women (4%), and IVDU's (3%). Additional training is provided in a private physician's office and an STD clinic. Training takes place during the course of patient visits and didactic sessions. Emphasis is on clinical instruction in the context of direct patient care supplemented by a comprehensive syllabus.
Results. Formal evaluation of the program includes exit interviews of the participants and 6 month followup. Preliminary data indicate that the trainees' goals are being met by the program.
Conclusion. An intensive, short-term clinical program is effective in modifying clinicians' management of HIV infection.

E.613

RESULTS FROM 1988 SURVEY OF MICHIGAN STATEWIDE SCHOOL HIV POLICY, STAFF INSERVICE, AND STUDENT EDUCATION

Hower, Barbara J., Project Coordinator*; Wanda Jubb**; AIDS Survey Advisory Committee***. * ** ***Michigan Department of Education, Comprehensive School Health Unit, Lansing, Michigan, USA.

Objective. To establish baseline data on the number implementing and quality of Michigan public school's HIV policy, staff inservice and student education.
Methods. Two AIDS Information Surveys were sent in May, 1988 on HIV program initiatives for the 1987-88 school year. A 62 item survey on district level activities was sent to 591 superintendents with an 88% return. A 91 item survey on building level activities was sent to 621 middle school principals with a 72% return and also to 615 high school principals with a 79% return. Random verification of survey data was conducted.
Results. Returns showed 74% of the reporting districts had a policy addressing attendance for persons with AIDS. Districts reported 34% had district staff inservice training with principals reporting 41% of the middle and 48% of the high schools had staff inservices. Both the middle and high school principals reported 41% had adopted written routine procedures for blood and other body fluid spills. A district, age appropriate K-12 program for educating students about AIDS occurred in 34% of the reporting districts though less than 10% taught anything in grades K-4, 17% in 5th, and 24% in 6th. Planned student AIDS education occurred in 62% of the middle and 78% of the high schools.
Conclusion. Assistance must be provided to school districts on policy issues i.e. confidentiality and handling body fluid spills. More total school staff inservice must occur. Districts need to incorporate student HIV education into a K-12 comprehensive school health education plan to be most effective.

E.610

TRAINING OF HEALTH CARE PROVIDERS IN SAO PAULO STATE.

Fernandes,M.E.;Ferreira,A.C.;Grandi,J.L.; Pinto, W.; Del Bianco,R.
Centro de Referência e Treinamento-Aids,SaoPaulo,Brazil

Objective.Trainning of health care providers to decrease the morbity and mortality caused by HIV infection in Sao Paulo State.
Methods. 80 hours course.40 hours of classes and 40 of practice. The program includes the following contents:Epidemiology,virology pathogebesis/imunology,clinical and laboratory management pediatrie Aids,blood bankscontrol,Human sexuality and Educational strategies.We established the same program with 5 clinical multiprofissional team from 5 references centers in Sao Paulo State. The course evaluation was made using a 15 marks questionary answered two times;before and after the course.
Results. 250 Health Care Providers trained in the period between april to december 1988.75% developed local programs for Aids prevention and control.
Conclusion. This is a very effective way of trainning and demands only a period of 2 weeks.

E.612

EVALUATING AIDS EDUCATION FOR HEALTH PROFESSIONALS

Pearsol, James; Harris, V.; Harrison, V.; Herrin, R.; Stephenson, J.; Gabel, L.
East Central AIDS Education and Training Center, Columbus, Ohio, USA

The East Central AIDS Education and Training Center (ECAETC) has developed a wide range of educational methods and programs to educate health care workers about AIDS. Evaluating the match of educational methods to health care provider needs for AIDS education has been an integral component of ECAETC efforts over the last 12 months.
METHODS. The ECAETC evaluation effort functions on three levels: 1) trainee assessment; 2) program impact; and 3) regional impact. Methods used to evaluate these included participant assessments of programs; program documentation and dissemination surveys; and site visits and interviews.
RESULTS. Trainee assessment: 2717 health care professionals completed ECAETC program evaluations. Eighty-eight percent of participants indicated favorable responses to: importance/value of training content, improvement of knowledge; quality of presentations and materials; and overall quality of presentations and programs. Program impact: 16,947 health care professionals participated in ECAETC programs, including 5851 physicians; 3813 nurses; 1171 dentists; 2011 allied health; 1953 students; 987 counselors; 71 physician assistants; and 1090 emergency medical technicians. Regional impact: 138 key organizations/agencies were contacted in order to establish formal, ongoing linkages; 6000 entries were made in ECAETC databases; 3000 newletters were distributed; and 5000 brochures were distributed. More study is needed in order to determine the long-term impact of such AIDS education and training centers.

E.614

THE RELATIONSHIP BETWEEN CONCERN ABOUT AIDS, KNOWLEDGE OF TRANSMISSION, AND BEHAVIOR CHANGE: CORRELATIONS AT THE INDIVIDUAL AND NATIONAL LEVELS

McCombie, S.C. and Hornik, R.C.
AIDSCOM, Annenberg School of Communications, University of Pennsylvania, Philadelphia, PA, U.S.A.

Objective. To examine correlations between concern about acquiring AIDS, knowledge of transmission, and reported behavior change.
Methods. Correlation coefficients were computed using aggregated data from 34 nations in which the Gallup organization conducted surveys of AIDS related knowledge, attitude and practice. The associations found were compared to results reported from several individual level studies which employed similar questions.
Results. At the national level, concern about acquiring AIDS was associated with belief in transmission by casual contact, a finding similar to several individual level studies that have shown a relationship between fear and inaccurate knowledge. Countries with higher levels of reported behavior change had lower levels of accurate knowledge. Lower levels of accurate knowledge were associated with reports of inappropriate behavior change such as avoiding homosexuals. Reports of behavior change that involved increasing condom use were associated with concern about getting AIDS, but not with accurate knowledge of transmission.
Conclusions. Caution is needed in drawing conclusions about the relationship between knowledge and practice from aggregated data. However, this study identified some concordance between results at the two levels of analysis, and suggests that inaccurate knowledge is associated with high levels of concern.

E.615

CHANGES IN AIDS-RELATED KNOWLEDGE, ATTITUDES AND BEHAVIOURS OF HIGH SCHOOL STUDENTS IN GREECE

George,Papaevangelou;Dardavesis,T.;Kioseoglou,G.;Achlades,C. and Papaevangelou,V.
University of Thessaloniki, Thessaloniki, Greece.

Objective.To estimate the AIDS-related knowledge,attitudes and behaviours of high school students and evaluate factors affecting their changes.
Methods.A questionnaire was developed and administered to a national representative sample of 5213 high school students,probing their knowledge about transmission and prevention of HIV,their attitudes and their behaviours about AIDS.
Results.Accurate responses about the main routes of transmission were given by more than 90% of the students.AIDS-related knowledge was associated with age and socioeconomic level.Females were less knowledgable than males,especially in younger and those living in provincial cities.The level of misinformation was high since 27-35% believed that HIV could be transmitted through casual social contact or by mosquitoes.Mass media and pamphlets distributed through the electricity bill were the main sources of information. Only 11.6% attended relevant lectures.Changes in sexual behaviour were declared by 28.7% of the students.They were more common in males and in older students.Suppresive measures for containment of the disease were suggested more often by younger and male students.Females and older children requested more information and could more often accept carriers as school-mates.
Conclusion.There is great need of implementing a systematic effective educational school programme to improve AIDS-related knowledge,and decrease misconceptions leading to unacceptable attitudes and behaviours.

E.616

VALUATION OF AN INFORMATIVE AND EDUCATIONAL PROGRAM IN TUSCANY' S HIGH SCHOOLS STUDENTS.

Imbarrato, AnnaMaria*;Orsini,C.**; Primi,C.*.
*University of Siena, Siena, Italy **Univerity of Florence, Florence,Italy

Objective. To value the preventive capability of some informative instruments, which are different in modality of creation.
Methods. The informative validity is measure by a questionnaire, purposely created. The research has been carried out on statistical sample of students of province of Florence. The first valuation has been before the informative programs (video-tapes) and the second after it.
Results. With this questionnaire has been possible to verify the efficacy of the message and the modification of behaviour.
Conclusion. we could be able to realise a proper preventive behaviour, today it constitutes the only form of struggle against the disease.

E.617

AIDS INFORMATION AND TEEN-AGERS IN PARIS

Cartacheff, Ivan* ; Deniaud, F.** ; Bravard, C.*
* Santé Scolaire du Rectorat de Paris, France. ** Unité d'Oncologie Virale, Institut Pasteur, Paris, France.

Objective. To describe the impact of AIDS information on teen-agers, some of them socially vulnerable.
Methods. 500 students from three secondary schools in the north of Paris, age 13 to 16, have been informed on AIDS in February and March 1988. The sessions were informal, with video and slides. A few weeks later, 335 (sex ratio = 1) responded to a confidential multiple-choice questionnaire. 81% reported no sexual relation. 75% were living in an unfavorable environment: low socio-economic level and ethno-cultural differences (families of North African immigrants and Asian refugees).
Results. 54% felt misinformed before this program. After it, the definition of HIV was better understood (96%) than AIDS (70%). 55% knew the three transmission routes among eight choices. Only 60% knew that seropositives and asymptomatic carriers are contagious. 61% misunderstood what "seropositive" is. Principles of prevention were well assimilated (89%) but 61% would not wait long enough before having the antibody test. Results in the more vulnerable group were not significantly different.
Conclusion. Appropriate information among teen-agers and vulnerable youth has to be stressed :
- transmission modes, particularly sexual, e.g. : HIV infection can escape notice ; asymptomatic infected persons are contagious.
- the 3-6 months delay before testing.
- instructions for condom use (e.g. avoid oil-based lubrifiants).
- the necessity not to change sexual partners.

E.618

AIDS INFORMATION IN FRENCH YOUTH

Deniaud, François
Unité d'Oncologie Virale, Institut Pasteur, Paris, France.

Introduction. AIDS information is still underdeveloped amongst french youth. Media may be incorrectly perceived. Only a minority have benefited from personalized information, mostly at school, given by physicians, school nurses or educators.
Objective. To improve AIDS prevention for the young.
Methods. Among the 10.000 students that I personally informed from June 1987 to December 1988, more than 1500 expressed their opinion through an anonymous questionnaire.
Results. AIDS provokes contradictory attitudes : although they deny any direct threat from the epidemic, the young are bothered and disturbed by the media giving too much heterogeneous information that is sometimes incoherent and polemic. They feel that AIDS will in the short term modify their sexual and social behavior ; they are waiting urgently for authentic, more human and explicit information, indispensable for AIDS awareness. To better involve the young in AIDS prevention, new models of information are suggested, e.g. a "second generation information" : we need motivated young volunteers, previously trained and informed to convey basic data on AIDS, leading to concrete preventive counseling.
Conclusion. - The more specifically designed information modes given by adults or youth leaders to the young, the more efficient the prevention ;
- School is one of the best environments to experiment with these models (formal and non-formal) ; - personalized information delivered to small groups is necessary to teach them how to use condoms and to recommend to them their use in any new relationship (always of uncertain outlook)

E.619

Impact of Mandatory AIDS Education in Ontario Schools, 1987

Arlette Lefebvre, M.D., F.R.C.P.C., Stanley E. Read, M.D., F.A.A.P., F.R.C.P.C., Nathan Snyder, Thomas Hogan, M.A., Evan Collins, M.D., F.R.C.P.C.
Hospital for Sick Children, Toronto, Ontario, Canada

Objective: This study examines the impact of mandatory Aids Education initiated in Ontario Schools during the fall of 1987.
Methods: One hundred and eighty students - 135 females, 45 males, mean age 16.3 years - working as volunteers in 13 Toronto area hospitals were surveyed during the summer, in terms of 1) General Health Knowledge, 2) Knowledge about HIV infection 3) Attitudes towards persons with Aids and safe sex practices, using both open ended and multiple choice questionnaires.
Results: Knowledge about HIV, but not Attitudes, was found to correlate positively with general health scores. The only variables to correlate significantly with attitude scores were sex (p 0.001) and sociocultural background (p=0.005), with females and children of Canadian, American and European backgrounds being significantly more positive in their attitudes towards safe sex and persons with Aids than males and children of Asiatic or Third World countries. Approaching significance were the trends for children of highly educated parents (especially health professionals) to be more negative than children whose parents had not completed high school.
Conclusion: Increased knowledge about HIV does not necessarily guarantee positive attitudinal changes.

E.620

AIDS KNOWLEDGE, ATTITUDE AND BEHAVIOUR PATTERNS AMONG UNIVERSITY STUDENTS IN IBADAN. NIGERIA.

OLADIMEJI OLADEPO Ph.D M.P.H.
W.R. BRIEGER M.P.H. University of Ibadan, Nigeria.

This study investigated the knowledge, attitudes and Personal behaviours of University Students related to AIDS. Two hundred and fifty two Students from the University of Ibadan randomly selected from eight faculties were surveyed. Results indicated that 58.7% of respondents knew that AIDS is caused by a virus but 72.6% thought the disease could be spread through kissing, hugging or shaking hands and 48.0% belief they cannot have AIDS. Most respondents showed a high degree of aversion to AIDS victims while about a qufter reported having multiple sexual patners in the last five years. The results suggest that well organized, specifically targetted health education programmes are needed for University Students.

E.621

HIV RELATED BELIEFS, KNOWLEDGE AND BEHAVIORS AMONG SECONDARY SCHOOL STUDENTS IN KINSHASA

N'Galy, B.*; Eke, T.**; France, B.***; Kalombo, Kitoto*; Kamenga, M.****; Vimindu, N.*****. *National AIDS Programme Coordination Bureau, Kinshasa, Zaire; **CRSM, Kinshasa; ***PSI, Washington, D.C.; ****Projet SIDA, Kinshasa; *****EPS Division Urbaine, Kinshasa.

Objectives. To assess HIV related beliefs and knowledge (BK) among adolescents in secondary schools and to evaluate the effectiveness of AIDS educational conferences(AEC) in schools as a means to improve AIDS-related knowledge of students.
Methods. One group (GpA) of secondary schools was randomly selected for a series of AEC. A second group (GpB) of schools was also selected from schools where students did not attend the conferences. A self-administrated anonymous questionnaire to assess BK was completed 4.5 months after the AEC by students in the last two years of secondary schools.
Results. A total of 1000 students (46% males, 54% females, aged 15 to 26 years, mean age 22.3) were enrolled in the study. Three percent of them thought incorrectly that AIDS does not exist, 7% and 12% respectively believed that there is a cure for AIDS and that a vaccine exists.
Percentage of correct responses regarding knowledge of HIV transmission

	AIDS risk factors					Non-AIDS risk factors		
School Group	PT	BT	NS	Sex	MB	Sweat	Public toilets	Clothes
GpA	79.3	93.8	94.4	70.2	86.0	96.3	96.0	98.0
GpB	79.0	92.0	91.5	77.3	82.7	99.3	95.6	96.0
Total	79.0	93.0	93.0	74.0	84.0	97.0	96.0	97.0

PT=Perinatal transmission; BT=Blood transfusion; NS=Needles and Syringes, MB=Mosquitoe bites.
Conclusion. We found that over 80% of respondents, when prompted, correctly identified HIV-associated risk factors. This high correct response rate was independant of participation in a conference on AIDS suggesting that the use of AEC in these schools was not an effective tool to improve HIV-related knowledge of the students. Other methods of increasing knowledge in this group need to be explored.

E.623

BLOOD, SEX AND NEEDLES

Potts, Malcolm
Family Health International, Durham, North Carolina USA

In Africa, HIV transmission continues to be through heterosexual intercourse. In North America, homosexual intercourse has been numerically more important, although heterosexual transmission is rising slowly and IV drug abuse is increasingly significant.

All three routes of transmission unequivocally give rise to self-sustaining epidemics. By contrast, although transmission can occur through contaminated blood given for transfusion, such accidents either result in a single case or a small cluster of cases and are self-limiting.

Preventive strategies must focus resources on those individuals who have most sexual partners and, where appropriate, IV drug abusers. Unfortunately, these individuals often fall outside routine health services and in many settings their practices are illicit or frankly illegal. Rapidly emerging as the key problem in many parts of the world is that the leaders of society who control resources and set policies find it acceptable to clean up the blood supply but difficult -- and sometimes virtually impossible -- to sponsor projects to educate and provide condoms and clean needles to those groups where the epidemic is spreading most rapidly. Ways of overcoming this problem will be discussed, based on the experience of AIDSTECH internationally.

E.625

E.622

A SURVEY OF AIDS RELATED KNOWLEDGE AMONG ITALIAN MEDICAL DOCTORS

Perucci, Carlo A.*; Borgia, P.*; Arca', M.*; Soscia, F.**; Rezza, G.*** and Abeni, D.*. *Regional Epidemiologic Unit, Rome, Italy; **Local Health Unit LT03, Latina, Italy; ***Ministry of Health, Rome, Italy.

Objective. To gather information about AIDS related knowledge, in order to plan educational programs for medical doctors (MD).
Methods. Administration of an 80-items multiple choice questionnaire to a sample (n=286) of MD from the National Health System. "Prominent" questions have been grouped into 6 scores concerning the following topics: cancer (not AIDS related) mortality [as a "control" score] (TUM), HIV biology (BIO), modalities of transmission (TRA), HIV screening tests (SCR), clinical aspects including therapy (CLI), and perinatal transmission (PED). Correct answers were awarded 2pts and uncorrect 1pt. The association of scores with age, sex, area of practice, was tested using the OR estimate. Correlations between scores were estimated using the r coefficient.
Results. A higher average level of AIDS related knowledge was noted for BIO and PED (1.68 and 1.63 pts per item, respectively), and a lower one for SCR and TRA (1.50 and 1.51), but the highest score was obtained in the TUM "control"(1.79). The strongest correlations were between BIO and CLI (r=.466), and between TRA and SCR (r=.388). No significant difference of knowledge by sex, age, area of practice has been observed.
Conclusions. AIDS related knowledge has not yet reached the level of other "classical" issues met in medical practice. In particular, the widespread need of correct information of MD about an appropriate use of HIV screening tests and about relevance of specific modalities of transmission and effective instruments of prevention must be stressed.

E.624

Developing an HIV/AIDS Training Institute for Administrators of Health Facilities

Joanne L. Weiss,* M.S.P.H, S.B. Gelmon,* M.H.Sc.
*The Association of University Programs in Health Administration, Arlington, VA, USA

Health services administrators are facing new challenges and demands as their organizations care for an increasing number of AIDS patients. While caregivers in general have benefitted greatly from the development of an extensive body of knowledge about AIDS and from their experiences in treating the disease, health care managers have not benefitted to the same extent from information specifically focussed on management issues. The development of the HIV/AIDS Training Institute for Administrators of Health Facilities bridges this knowledge gap. The project is developing a curriculum to be used in continuing education programs for health service managers. This curriculum will educate and inform health managers on such topics as the financial, legal, and moral/ethical issues involved in the management of facilities that care for AIDS patients, plus the strategic, operational, and personnel management policies that must be considered. Representatives from the field of health care management, as well as faculty from university programs in health service administration have been consulted as to what they believe to be the most pressing issues and concerns for administrators. A survey of 90 health administration and public health programs at universities in the U.S., Canada, and Puerto Rico was conducted to assess the extent to which AIDS is addressed in graduate and undergraduate program curricula. Results indicate that the majority of health administration programs offer little to no education on the management issues involved with AIDS patient care. Regional correlations were noted between areas where incidence and prevalence of AIDS was medium to high and the extent to which programs in those areas addressed AIDS in their curricula.

E.626

PHARMACISTS INVOLVEMENT IN CLINICAL DRUG TRIALS SPONSORED BY THE AIDS CLINICAL TRIALS GROUP: THE ROLE OF INVESTIGATIONAL RESEARCH PHARMACISTS.

Wong, Roberta J, Woodring, H; Volberding P. San Francisco General Hospital, San Francisco, California, USA.

Objective: To describe the activities of pharmacists within the AIDS Clinical Trials Group(ACTG) and to establish a network of research pharmacists in the United States who specialize in AIDS clinical trials.
Methods: Since the creation of ACTG in 1986, pharmacists have been a crucial part of the health care team in developing, implementing and completing high quality clinical trials. From less than 20 centers in 1986, there are 51 centers currently in operation with at least one pharmacist at each center. Two questionnaires were mailed to gather information about the institution and the individual's practice. Data from SFGH is not included in these results.
Results: Out of 36 questionnaires sent to 36 hospitals, 31(86%) responded. Nine of 36(25%) respondents work on ACTG activities 0.75-1.00FTE with 17/36(55%) who work 0.25-0.75FTE and 5/36(16%) who work less than 0.25FTE. Individuals working part-time complete their practice with other pharmacy-related activities such as drug monitoring, adjusting drug doses, dispensing, and teaching. A follow up questionnaire was sent to 56 individuals at 51 institutions with 39(76%) responding. Four of 51(13%) have more than one pharmacist or technician on the ACTG grant. Nine institutions have another position for non-AIDS investigational drug services. Only two individuals have attended International AIDS Conferences due to expense and scheduling conflicts. While only 2 have written articles on AIDS, 10 of 39(25%) respondees regularly give 1-4 lectures per month in the community. 34 out of 39(87%) indicate a strong interest to increase their participation in the ACTG process with 33 of 39(85%) volunteering to offer advice on study design.
Conclusion: A select group of pharmacists are involved in completing AIDS clinical research in the United States. Pharmacists form an integral part of the health care team and are eager to provide assistance with future study design in the search for new medical interventions for HIV infection. Future plans include the development of a regular newsletter and periodic group meetings.

E.627

AN INTEGRATED APPROACH TO HIV-RELATED CURRICULUM FOR PHYSICIAN'S ASSISTANT STUDENTS.

Pollard, Richard; Lyons, B.A. and Muma, R.D.
Department of Physician's Assistant Studies, The University of Texas Medical Branch, Galveston, Texas, USA.

The Department of Physician's Assistant Studies developed and implemented a curriculum to teach physician's assistant students about the didactic, clinical, and psychosocial aspects of HIV infection. Student attitudes about AIDS and AIDS patients were measured using the Shrum-Turner AIDS Attitude Questionnaire at various points in the program curricula. The object of the model curriculum has been not only to make physician's assistants students more knowledgeable about the pathophysiology, diagnosis, and prevention of AIDS diseases but to stimulate an awareness of the psychosocial consequences and implications of HIV infections as well. An integrated methodology was devised for the junior year curriculum which placed appropriate information in numerous existing courses beginning with the Patient Evaluation II and Problem Solving Techniques I and extending through the Preventive Medicine and Community Health and Human Dynamics III courses. For senior students, the materials were covered in several senior seminars at the end of clinical rotations. Senior students also participated in a 4-week rotation with direct clinical contact with HIV-infected patients. Prior to patient contact, all students are taught basic principles in pathophysiology, diagnosis, and treatment/prevention for care of patients with HIV infections. Results of the attitude survey will be utilized to make adjustments in the program curriculum.

E.628

SELF-SELECTION AMONG PROSPECTIVE HEALTH CARE PROVIDERS AS A FACTOR IN AIDS-HIV EDUCATION

Grade, Margaret M.; Piscitello, T. J.; Bartnof, H.S.; Koenig, B.A.; Zegans, L.S.; Ziegler, J.L.
University of California, San Francisco School of Medicine, San Francisco, California, United States.

Objective. To identify the characteristics of those individuals who elect to take an AIDS education course. In so doing, to ascertain whether or not need for education is being met by available opportunities within a major medical training institution. Method. Incoming medical and nursing students at the University of California, San Francisco (UCSF) were surveyed with respect to demographic characteristics (age, race, gender), previous clinical experience with AIDS patients, attitudes germane to AIDS, perceptions of occupational and personal risk, and knowledge about AIDS. Identifying factors were examined between those students who elected to take a 10 week, 10 hour AIDS elective course offered through the UCSF School of Medicine and those who did not. Results. Results from Chi-Square analyses indicated that the decision to take an AIDS elective course was contingent upon both race and gender. A substantially greater proportion of women elected to take the course in comparison to men, and a substantially greater proportion of white students elected to take the course in comparison to non-white students. No significant differences emerged between students who opted to take the course and those who did not in regard to mean age, and the number of AIDS patients worked with prior to entering professional training. Students who elected to take the course, however, started out with significantly greater levels of knowledge about AIDS in comparison to students who elected not to take the course. Attitudes likewise differed and will be reported. There were no significant differences in perceived risk.

Conclusions. Those persons who might be considered most in need of AIDS education (those, for example, with lower levels of knowledge) tend not to partake of available academic AIDS education. Such a finding lends further support to an argument for systematically incorporating AIDS education within required professional curricula. Greater attempt must also be made to appeal to the sensibilities of those individuals whose apparent tendency is to forego education of importance to the optimal care of HIV-spectrum patients.

E.629

FACTORS PREDICTIVE OF AIDS-HIV KNOWLEDGE AND ATTITUDES AMONG NURSING AND MEDICAL STUDENTS

Piscitello, Thomas J*; Grade, M.*; Bartnof, H.*; Koenig, B.*; Blevins, N.**; and Irish, T.**. University of California School of Medicine, San Francisco, California, USA; **Pacific Graduate School, San Francisco, California, USA.

Objective. To identify psychosocial and psychological variables that explain negative attitudes toward AIDS patients and inaccurate medical information about AIDS among incoming medical and nursing students. Methods. A total of 113 incoming medical and 118 incoming nursing students were surveyed regarding their knowledge and attitudes about AIDS, their estimate of personal and occupational risk for HIV infection, and the number of AIDS patients with whom they have had professional contact. Students were also surveyed regarding their level of homonegativism, death anxiety, and intolerance of drug users. Results. The majority of students answered 50% or more of the knowledge items incorrectly. Nursing students scored higher on AIDS knowledge than medical students, although no differences emerged between nursing and medical students in respect to their overall AIDS attitudes, nor in their estimates of risk for infection. The majority of students, however, overestimated risk for HIV infection when compared to scientifically established estimates of risk.

Multiple regression analyses were performed to determine the best possible linear estimate of AIDS knowledge, negative AIDS attitudes, and 2 AIDS attitude subscales: professional resistance (measuring a student's unwillingness to work with AIDS patients), and negative affect (measuring a student's endorsement of negative affective responses in regard to a person with AIDS). Predictor variables were entered stepwise into the regression equation following the forced entry of items from the Crown-Marlowe social desirability scale. Results indicated that the best predictor of inaccurate medical information about AIDS was an overall negative attitude towards AIDS. Lack of clinical experience with AIDS patients, exaggerated estimates of risk, and homonegativism also significantly added to the prediction of low levels of AIDS knowledge. The best predictor of negative AIDS attitudes was exaggerated perception of risk. Homonegativism, an intolerance of drug users, lack of clinical experience with AIDS patients, high death anxiety, and low levels of AIDS knowledge also significantly added to the prediction of negative AIDS attitudes.

The best predictor of both professional resistance and negative affect was homonegativism. Exaggerated risk perception, an intolerance of drug users, and lack of clinical experience also significantly added to the prediction of professional resistance, whereas only an intolerance of drug users, and low levels of AIDS knowledge significantly added to the prediction of negative affect. Conclusion: These results suggest the importance of considering pre-existing fears about AIDS when designing educational interventions that will be effective in changing attitudes. Positive attitudes are apparently essential to the assimilation of even the most basic factual information about AIDS. The results also suggest that increased experience with AIDS patients, as well as greater familiarity and exposure to the lifestyles of groups at high risk might help ameliorate negative AIDS attitudes and reduce professional resistance of AIDS patients among future health care givers.

E.630

Projet de communication au congrès international sur le SIDA

Les travailleurs sociaux et les représentations qu'ils peuvent avoir sur le SIDA

Mieux Connaitre, Combattre, Prévenir

E.P.S.I. (Ecole de Service Social), Clermont, France
Morin, Nicole

L'objet de la communication que nous souhaitons faire est de montrer comment un centre de formation de travailleurs sociaux peut-être à l'origine d'un mouvement de sensibilisation sur ce qu'est le SIDA, et cela à partir d'une part de recherches menées par des étudiants et des professionnels, d'autre part de journées d'information et de formation.

partant de ce principe, nous avons proposé un travail qui pouvait s'articuler de la façon suivante :

- une phase d'investigation sur le terrain afin de connaitre les réalités
* population concernée * réaction des travailleurs sociaux * ceci grâce à 2 mini recherches menées l'une par les étudiants, l'autre par les professionnels de la Région.
- une phase d'information * pour grand public (2 jours) * de travail (6j.) amorce d'une action collective de prévention et d'information dans un lycée.

Le tout devant déboucher sur la production d'un document final qui aurait pour objectif de situer le problème du SIDA en AUVERGNE.

Notre souhait était de mobiliser par un travail action-recherche le maximum de professionnels autour du problème du SIDA.

E.631

WORKING WITH AIDS IN THE CARIBBEAN: A MODEL PUBLICATION FOR REGIONAL TRAINING OF HEALTH CARE PROVIDERRS

Helquist, Michael*; Macks, J.*; Dilley, J.*;
Duke, B.**; Basses, D.***
*AIDSCOM Washington, D.C.; ** Ministry of Health, Trinidad and Tobago; *** Caribbean Epidemiology Centre and the Pan American Health Organization, U.S.A.

Objective. To address the information and training needs of health care providers in the Caribbean regarding AIDS prevention counselling with clients and patients.
Methods. Two sets of regional train-the trainer workshops for 60 health care providers from 19 English-speaking countries in the Caribbean led to the developement of training guide to be used throughout the region. Components of the training and the guide were tested among focus groups; and the pilot trainings were implemented in national workshops as well. Materials were developed and tested in the field.
Results. Sixty health care professionals from the Caribbean rated the workshps as informative, effective, and valuable to their AIDS prevention efforts, During a four-month period more than 3000 individuals in 19 countries were reached with AIDS prevention counselling messages by these same 60 participants. As a result, a training guide was developed and is currently in use in the field.
Conclusion. A train-the-trainer model for disseminating AIDS prevention counselling skills can be effective among health care providers in the Caribbean. A guide to supplement these trainings has been useful to ongoing efforts.

E.632

IMPLEMENTING UNIVERSAL PRECAUTIONS IN A TEACHING HOSPITAL UTILIZING A CASCADE TRAINING METHOD

Hadley, D., and Jensen, Peter C.
Departments of Nursing and Medicine, Veterans Administration Medical Center and The University of California, San Francisco, California, USA

Ours is a 300 bed teaching hospital with 1500 full and part-time employees in an area of high endemicity for HIV infection. The need to introduce concepts of universal precautions provided the means to simultaneously disseminate basic HIV information. This program consisted of the following elements: 1) a core MD/RN faculty, 2) support of hospital administration, and 3) emphasis of content to accommodate dissimilar work units. Employees were chosen by supervisors to be trainers based on criteria that selected for teaching potential rather than by professional status within the work unit. Two half-day seminars were attended by 38 trainers from 23 departments. Trainers were then required to hold at least one training session within their work groups. The faculty advised on individual programs and monitored content. In the first 3 months of the program, nearly 750 hospital employees received documented training. As a result, there has been 1) widespread compliance with new infection control procedures, 2) decreased anxiety regarding HIV transmission in the workplace as evidenced by decreased demand upon infection control nursing staff, 3) decreased use of inappropriate barrier protection, and 4) increased demand for Hepatitis B vaccine among high-risk groups. Hospital employees can successfully be taught basic HIV concepts by peers rather than by traditional teachers such as physicians and nurses.

E.633

SEXUALLY TRANSMITTED DISEASES AND THE AIDS EPIDEMIC: POLICY IMPLICATIONS

Sokal, David*; Hamill, D.**.
*Family Health International, Research Triangle Park, North Carolina, U.S.A.,
**Research Triangle Institute, Research Triangle Park, North Carolina,U.S.A.

Objective. Describe the policy implications of data showing that STDs increase HIV transmission.
Methods. Computer simulations using two different models of the effect of STDs on HIV transmission were run and the history of successful AIDS control efforts in the United States was reviewed.
Results. Computer simulations suggest that control of STDs will slow the HIV epidemic. If appropriate educational strategies are followed, the epidemic's impact is likely to result in sustained behavior change and a lower incidence of STDs in the population. Additional considerations suggest that STD control should be the priority intervention in developing countries with high rates of STDs.
Conclusions. 1. It is important to use persons with AIDS in health education and STD programs. 2. STD control should be a priority because (1) behavior change and condom use are generally resisted until late in the course of the epidemic; (2) treatment of STDs is highly sought by high risk groups; and (3) STD treatment facilitates health education of high risk individuals.

E.635

REPORTED KNOWLEDGE, CHANGES IN MID SOUTH TEXAS URBAN RESIDENTS: LONGITUDINAL RESULTS OF AN INTENSIVE HIV INFECTION COMMUNITY INTERVENTION

Galavotti, Christine***; Zbylot, P.*; Shoemaker, P.**; McAlister, A.*; McCuan, R.*; and Reed, C.**** *The University of Texas Health Science Center, Houston, Texas, USA, **The University of Texas, Austin, Texas, USA, *** Centers for Disease Control, Altanta, Georgia, USA, ****Texas Department of Health, Austin, Texas, USA.

Objectives: To examine the effects of a community intervention on reported knowledge relating to HIV infection.
Methods: Randomly sampled residents of a large Mid South Texas city completed a telephone survey in 1987 (n=493) and one year later (n=207, new sample of respondents). The survey included questions on HIV-related knowledge, attitudes, behavior and sources of information. The intervention included an AIDS hotline, featured communications in the local media, safer sex workshops, counseling and testing, and the passing of an AIDS anti-discrimination ordinance.
Results: Knowledge about transmission of HIV and HIV symptoms increased 8% ($p<.05$) and 15.5% ($p<.01$) respectively. At baseline, 43.4% cited television as the most influential source of information about AIDS, whereas physicians and health care providers were the most important source a year later (18.8%), followed by television (16.8%), mailings (12.8%), magazines (10.8%) and newspapers (8.0%).
Conclusions: Reported knowledge increased in a cross-section of urban residents after a multidimensional community AIDS prevention program. Reported information sources increased in variety which is a key element in successful public health AIDS prevention campaigns.

E.637

AIDS KNOWLEDGE AND ATTITUDES OF STUDENTS FROM A SELECTIVE U.S. GIRLS' PAROCHIAL PREPARATORY SCHOOL. Genser, Sander*; Genser, S.**; Preston, A.***; Haverkos, H.*.

*National Institute on Drug Abuse, Rockville, Maryland U.S.A.;
**Potomac, Maryland, U.S.A.; ***Washington, D.C., U.S.A.

Objective: To trace the early development of AIDS knowledge and attitudes in primary school students in a selective Episcopal girls' preparatory school and compare results to a national sample of adult women. Methods: Questions covering basic biomedical facts and attitudes about AIDS were selected from the National Health Interview Survey (Natl Ctr for Hlth Stat). The resulting questionnaire was administered to entire classes in the 5th and 6th grades (ages 10-12) for a total N=72. Results: In this unusual sample of students, the 50th percentile corresponds in overall aptitude to the 97th national percentile. In the school, 88% of families pay the full annual tuition of over $8200/yr., 99% of graduates attend selective colleges & there are 16% minority students & 9% foreign nationals. On the factual questions, the 5th and 6th grade scores are significantly different at 41% & 58% respectively. Patterns of responses reveal areas in which these subjects (& samples of male students and adults from different studies) show developmental progression. The acquisition of accurate knowledge or beliefs, the rejection of inaccuracies, and the implications of this unique sample for a cognitive/developmental theory of the acquisition of AIDS knowledge and beliefs are discussed. Conclusion: Studies of the early patterns of information acquisition may guide educational efforts to strengthen the often tenuous connection between knowledge and effective prevention.

E.634

AIDS/HIV INFECTION : AN OUTREACH PROGRAM FOR HEALTH CARE PROFESSIONALS

Shin, Diana M.*, Flaskerud, J.H.**, Fahey, J.L.*
*Center for Interdisciplinary Research in Immunology and Disease (CIRID) at University of California at Los Angeles (UCLA), USA **CIRID at UCLA and UCLA School of Nursing, USA

Objective: To develop a comprehensive AIDS educational program specific to the needs of health care professionals.
Methods: The program is comprised of four components: needs assessments, interventions, follow-up and evaluation. Interventions utilize conferences, lectures, workshops for health professionals. These also include the training of those individuals responsible for the instruction of physicians, medical students, nurses, nursing students, and other medical staff. The use of audiovisual educational tools (AIDS Training Modules-C.E. Lewis, MD) is incorporated into the programs when appropriate. Collaborations with other medical institutions and organizations promote the implementation of programs. Resource materials produced by CIRID at UCLA include the *AIDS/HIV Reference Guide for Medical Professionals, Third Edition*, and *AIDS/HIV Infection: A Reference Guide for Nursing Professionals*. In addition, periodic updates are provided through the *AIDS Medical Update* and *AIDS Nursing Update* newsletters. Needs assessments and evaluations include: surveys of AIDS-related needs of nurses, physicians, dentists, and dental students; evaluation of CIRID AIDS publications; and AIDS educational programs developed by CIRID.
Results: Needs assessments have indicated a need for AIDS knowledge and skills by health professionals and a preference for continuing education courses as the method to gain such knowledge. Surveys have shown AIDS related fears to be prevalent among health professionals and students and a deterrent in giving health care to the HIV-infected individual. Evaluation has shown that continuing education can effect a change in knowledge and attitudes. Data from a one-day AIDS conference for nurses demonstrated that significant pre- and post-test improvements had occurred in both knowledge and attitudes ($p<.05$); these were retained at re-testing ($p<.05$) of the participants three months later. The largest differences took place in the group with low knowledge of AIDS.
Conclusion: Our experience indicates that optimal AIDS education for the health professional relies on addressing their specific concerns using both traditional and interactive educational tools. This program has been conducted in several sites (including outside California) and can be adapted to local circumstances.

E.636

E.638

AIDS KNOWLEDGE AMONG UNIVERSITY STUDENTS

Beltran, Eugenio*; Katz,D.*; Vader, J.P.**; Foxman,B.* et al.
*University of Michigan, Ann Arbor, Michigan, **Institut Suisse de la Sante Publique, Lausanne, Switzerland.

Objective. To assess AIDS knowledge among students at a large Midwestern university.
Methods. A 24-item questionnaire assessing knowledge of HIV prevalence, transmission, and infectivity was administered by telephone to 214 randomly-selected students at the University of Michigan in March 1988 (response rate =96%). Each student was also asked about socio-demographic characteristics and whether the student was, by self-assessment, "sexually active."
Results. Students are very well-informed about sexual transmission of AIDS; more than 98% agreed that condoms are protective and that risk increases with increasing number of partners. However, many still believe AIDS can be transmitted by casual contact: shared eating utensils and toilets were considered unsafe by 30% and 23%, respectively. Age, sex, race and sexual activity are the most important predictors of AIDS knowledge. Knowledge is greater among students aged 21 and older (odds ratio=2, 95% confidence interval=1.1-3.4); men (OR=1.7, CI=1-2.9); whites compared to blacks and Hispanics (OR=2, CI=.7-5.7); and sexually active students (OR=1.5, CI=.9-2.6). Age modifies the relationship between sexual activity and knowledge (OR=.9 and 2.1 for younger and older students, respectively).
Conclusion. Education efforts directed towards university students need to distinguish more clearly between safe and unsafe activities. Health educators should target particular groups — women, younger students, and minorities — that are less knowledgeable.

E.639

SURVEY OF COMMUNITY COLLEGE STUDENTS' AIDS KNOWLEDGE, ATTITUDES, AND RISK BEHAVIORS

Hudson, R.A.;* Freeman, A.C.;* Petty, B.A.;* Tabori, J.**; and Haley, Charles E.*, *Dallas County Health Dept., Dallas, TX, USA, **Professional Management Associates, Rockville, MD, USA.

Objectives. To determine the baseline level of AIDS knowledge and attitudes prior to a major educational intervention, to provide data for development of curricula, to measure the level of risk-taking behavior. Methods. Students in 2 community colleges were asked to complete a 55 question survey during regularly scheduled classes. A seven point likelihood scale rather than a binary true/false scale was used to measure knowledge of mechanisms of AIDS transmission. Results. A total of 429 students completed the survey: 60% females, 30% married, 41% freshmen. The students answered most transmission questions correctly but 30% believed that HIV could be transmitted by living with an infected person. 33% thought AIDS cases should be quarantined while 58% would attend class with a person with AIDS. 43% of the men with multiple sex partners thought they might be exposed to HIV in the next 5 years. Women were less likely to engage in promiscuous sexual behavior than men (19% to 6%), but also less likely to use condoms. Other differences emerged when controls were introduced for age, marital status and ethnicity. Conclusions. AIDS education programs aimed at heterosexual college age students must take into account gender based safer sex behaviors, attitudes, and knowledge.

E.640

A DEVELOPMENTAL APPROACH TO AIDS/HIV EDUCATION

Copello, A. Gene*; Sheets, R.*; Lindsay, L.*; Harris, V.**; Sy, F.***; and Roberts, M.*
*Vanderbilt University, Nashville, Tennessee, USA, **Meharry Medical College, Nashville, Tennessee, USA, ***University of South Carolina, Columbia, South Carolina, USA

Objective. To plan and pilot a systematic developmental approach to AIDS/HIV education in a variety of settings with different population groups.
Methods. 1) Analysis of developmental education literature; 2) establish core AIDS/HIV content for use across settings and populations; 3) design a needs assessment system which can detect population-specific issues of age, sex, sexual orientation, color, religion, attitudes, and behavior; 4) implement the needs assessment system in four settings with differing population groups (gay males, heterosexual youth in public school, employees of a conservative religious organization, and black participants of an AIDS training session); 5) for each setting, develop a curriculum consisting of the core AIDS/HIV content and the specific results of the needs assessment with emphasis placed on the developmental stage of the group's knowledge and attitude towards AIDS/HIV; and 6) pilot and evaluate the developed group-specific curriculua.
Results. Sensitivity to group-specific issues increased the motivational level of participants to learn about AIDS/HIV.
Conclusion. Assessing the group-specific needs of any AIDS/HIV education population group, with emphasis on the group's perceptions of need and further development, will increase the likelihood of program success.

E.641

SEX EDUCATION: AN IMPORTANT ELEMENT OF AIDS EDUCATION

Pinel, Arletty*
*Centro de Referencia e Treinamento-AIDS, Sao Paulo, Brazil

Objectives. To describe a sex education curriculum that has been used as part of an AIDS education program in Brazil.
Methods. A human sexuality curriculum was tested as a part of a training program on AIDS for 9 different groups: religious leaders, teachers, health care professionals, mental heahth professionals, social workers, human resource professionals of the private industry, professionals that work with abandoned children, general population, and sexual workers (male, female and transvestite prostitutes). The curriculum is divided in four parts: a)Values clarification b) Basic information on human sexuality c)Specific information on human sexuality (AIDS related) and d)Specific strategies for each group depending on their needs and interests.
Results. Sex education proved to be an important element in preparing the groups for the inormation on AIDS. This was especially true for the religious leaders (of 17 different religions) and sexual workers.
Conclusions.a) The lack of knowledge about sexual behavior brings about misconceptions and fears that interfere with the transmission of facts about AIDS. b) Sex education is a necessary element of AIDS education.

E.642

AIDS Inside and Out: A National Education Programme for Prisoners in England and Wales

CURRAN Len*; GALLWEY J**; GRIMSHAW J***; KILGOUR J****; MILLER D*****; THORNTON D******

* HM Home Office, London England
** Radcliffe Infirmary Oxford, England
*** The Landmark, London England
**** Director, Prison Medical Service, London, England
***** World Health Organisation, Geneva, Switzerland
****** Adult Offender Unit, HM Prison Service, London, England

Objective: To describe the design, implementation and evaluation of a national education programme for prisoners in England and Wales on AIDS and HIV.

Method: An advisory committee composed of outside and independent experts on AIDS and HIV and experienced prison staff produced an education package consisting of a 20 minute video, manual for tutors and 2 leaflets. The elements were based on research surveys of inmate fears and attitudes regarding AIDS/HIV. The video film was shot on location in prisons in England and Wales and directly addresses the concerns and fears expressed by prison inmates. Results: to be discussed.

E.643

THE 'THREE-FOR-FREE' PROGRAM: A STATEWIDE CONDOM DISTRIBUTION PROGRAM IN MARYLAND, U.S.A.

Wunderlich,Gary*; Hannon,Andrew**; Clark,Samuel**; Goldman,Anita**;Johnston,Pat**;Wiley,Andrew**
*AIDS Administration, MD Department of Health, Baltimore, MD,USA **Division of Family Planning, MD Department of Health, Baltimore, MD, USA.

Objective. Describe key components leading to the successful, rapid expansion of a Statewide inter-agency program which distributes over 1.6 million condoms annually from over 340 sites sponsored by over 170 Agencies.
Methods. Internal measures and self-administered questionnaires.
Results. Since 1983 the Maryland State Health Department's Division of Family Planning has had the objective of decreasing barriers to condom use by making free condoms available for anonymous pick-up at as many sites as possible Statewide. With interagency cooperation with the AIDS Administration, the rate of expansion over the last two years has been exponential:

Year	# Condoms Reported Picked Up	# Sponsors	# Sites
1986	72,506	24	32
1987	572,315	32	164
1988	1,600,000*	169	339

* (Provisional: Based on reporting for first three quarters of 1988)

Conclusion. The Three-for-Free Program is a highly efficient method of expanding access to condoms among high risk populations. With an average annual cost per active client of less than $20.00 per year, the Three-for-Free program is an effective model for preventive community outreach based on interagency cooperation.

E.644

DESIGNING AND IMPLEMENTING A.I.D.S. EDUCATION FOR STUDENTS AND THE GENERAL PUBLIC IN A SMALL NOVA SCOTIA COMMUNITY.

E.F. Bartel, B.B.; James E. Burton : Richmond County District Board,Nova Scotia, CANADA

Objective: To present factual, objective and responsible data to persons at risk in a typical rural Nova Scotia community. Despite the low incidence and prevalence rates for H.I.V. infection, the degree of promiscuity and illegitimate births observed provided evidence of high risk behavior with few or no identified H.I.V. cases. A multi-desciplinary committee was formed to represent the target population and the community as a whole; policy and educational programs were designed to represent the most current information available.

Method: Fourteen percent of the population received between three and nine hours of intensive material delivered in a multimedia presentation. Concurrently one hundred and sixty Grade III graduating students were targeted for nine hours of class time over a three day period. A standardized pre-test was administered to determine the level of knowledge; a standardized mail out test was administered one year later.

Conclusion: Behavior among the youth of the community sampled is entrenched and subject to intense peer pressure. The presentation of frank, current and relevant data is not enough to alter high risk behavior. A.I.D.S. education as it is presently taught will be ineffective in reducing the incidence of H.I.V. unless behavior is altered. Youth have identified parents and the medical profession as best able to provide honest information however, when tested that information does not alter high risk behavior. We contend that the approach must focus on values in the context of the society in which we live while presenting comprehensive, up to date and factual information.

E.645 EDUCATING THE PUBLIC ABOUT AIDS IN LIMA, PERU

Luján, Manuel*, Seba, Walter**, Varela, Luis***, Payne, Alice****.
*Peruvian Health Ministry, Lima, Perú, **Proyecto SIDA, Lima, Perú, ***Population Council, México, ****The Johns Hopkins University/Population Communication Services, Baltimore, Maryland, USA.

Objective. To develop an AIDS mass media information campaign for thr city of Lima, Perú.
Methods. Five steps were followed to develop an information campaign: 1) an audience analysis carried out through focus groups and a KAP survey of 1,900 households; 2) design of 3 TV and 2 radio spots; 3) pre-testing of materials in the target population; 4) production of spots; and, 5) dissemination through tv channels and radio stations.
Results. Audience analysis showed high public awareness about AIDS but a low prevalence of preventative behaviours. Also, great interest on the subject overode any objections to the use of mass media to promote safer sex, condom use included. Testing of materials showed identification, acceptance and a good comprehension of preventative messages.
Conclusions: Audience analysis and pre-testing were crucial to determine content and format of the AIDS education campaign.

E.646 ISSUES IN THE EVALUATION OF AIDS EDUCATION PROGRAMS: THE CALIFORNIA EXPERIENCE

Jang, Michael*, Moore, M.*, Forst, M.*; *The URSA Institute, San Francisco, California, United States.

Objective. To discuss the results and some of the critical issues in the evaluation of AIDS education programs in California.
Methods. All 87 of the state-funded community education and prevention programs for fiscal year 1987-88 were evaluated. Interviews were conducted with program directors and key program staff. All relevant educational testing materials were collected and analyzed.
Results. All of the programs met the objectives they had contracted to achieve. Specifically, programs reached the specified number and type of clients and those clients achieved the requisite level of educational competency regarding AIDS transmission and prevention. However, several problems were uncovered that cast doubt on the effectiveness of the programs to alter clients' attitudes and behavior. These problems related to evaluation design, test construction, test administration, and data analysis.
Conclusion. Most target groups reached by the educational interventions have achieved minimal levels of educational competency about AIDS transmission and prevention, and contracted program objectives were met. The state's program must move beyond emphasis on cognitive knowledge about HIV transmission and prevention and begin to stress interventions concerning, and evaluations of, attitude and behavior change.

E.647 EDUCATIONAL PROGRAMME ON AIDS - PEOPLE'S REACTION

Dr.A.B. Hiramani, Dr.Neelam Sharma, Central Health Education Bureau, Dte.General of Health Services, New Delhi, INDIA

OBJECTIVE: To study people's reaction to the educational programme on AIDS launched by the Govt. through television, radio and newspapers.

METHOD: One Hundred Four patients of Sexually Transmitted Diseases and 37 Blood Doners randomly selected from three Govt. Hospitals in Delhi were covered. Only 70 individual, who were exposed to the programme were interviewed with a set of closed and open questions.

RESULTS: Among all channels, television was rated as the most effective to inform the public about the disease. Most of the respondents found time of telecast appropriate, but the duration was considered to be shorter to comprehend various aspects of the disease. Very few acquired correct knowledge on mode of transmission, incubation period; and symptoms. On the other hand, many of the respondents acquired correct knowledge on preventive measures-avoiding extramarital and homosexual contact. The educational campaign did create fear among the public regarding blood donation. This contributed a disturbing drop in the number of blood doners. The blood doner respondents were frightened for donating blood for the fear of contracting AIDS by sharing common needle used for blood donation.

E.648 AIDS AWARENESS AMONG COLLEGE STUDENTS IN INDIA.

Verma, Shashi* and Pavri Khorshed**
*Incharge Computer Section, National Institute of Virology. Pune, India.
**Project Director, ICMR Centre for AIDS Research and Control (CARC). Pune, India.

Objective : To assess knowledge about AIDS among college students of a metropolitan city, Bombay, and a provincial city, Pune, both in Maharashtra state.
Methods : CARC carried out a limited questionnaire survey in October 1988. Anonymity was maintained and questions regarding personal sexual behaviour were avoided. Information was computerized for comparative analysis.
Results : A significantly higher proportion of Bombay students (62%) responded as compared to only 21.5% from Pune ($p<0.005$). About 77% of Bombay students compared to Pune ones indicated foreign magazines as the major source of information ($p<0.01$). In contrast, 60% of Pune and 35% of Bombay students had marked Indian newspapers/magazines as a major source ($p<0.05$) Overall, all students emphasised monogamous relationship. However, 51% of Bombay students as compared to 26% of students from Pune were aware of condoms for safe sex ($p<0.05$). There were a few misconceptions regarding transmission of HIV infection. e.g. 24% of students considered toilet seats to play a role in transmission. There were also several misconceptions concerning transmission through blood transfusion. This and subsequent surveys are presented.
Conclusion : The questionnaire survey though limited, establishes its usefulness in formulating health information programmes and indicates the need for a wider survey in different regions.

E.649 SEXUAL BEHAVIOUR OF UNIVERSITY STUDENTS: RESULTS FROM A PILOT STUDY

H.Letzel*, J. Fuger*, F.-D.Goebel**
*) PD Dr. H. Letzel, J. Fuger, STATICON Medizinische Forschungsgesellschaft mbH, Behringstrasse 12, FRG - 8033 Planegg

**) Prof. Dr. F.-D. Goebel, Medizinische Poliklinik der Universität München, Pettenkoferstrasse 8a, FRG - 8000 Muenchen 2

An exact understanding of the actual sexual behaviour of a population is essential for predicting the speed and the direction of the spread of AIDS. In our survey 358 students of medicine and psychology were given a detailed anonymous questionnaire about their sexual activities and attitudes. 86% of the students (307) returned the questionnaire. The result revealed that 15% had had more than one sexual partner during the preceeding three months. Anal intercourse was reported by 35/307 (11.4%). A large proportion of the students was reluctant to using condoms for various reasons. E.g. 42% (129/305) saw no indication for using condoms although 18 of them had reported sexual contacts to more than one partner during the preceeding three months including two students who had praticed unprotected anal intercourse.

We conclude that more specific concentration on young, sexually active subgroups of the population and their needs is mandatory. Our results indicate that knowledge of even medical students is not sufficiently reflected by avoiding risky sexual behaviour.

E.650 STUDY OF THE ATTITUDES AND BEHAVIOURAL CHANGES OF SELECTED EGYPTIAN GROUPS TOWARDS AIDS

Mohammed A.E.A. Hassan*
*Director The Arab Centre for Fighting Against AIDS, Cairo, Egypt

Objective. This study is to measure cognitive knowledge of selected groups of the Egyptian populace of the AIDS problem and to determine the changes, if any, of the attitudes and behaviours of the groups studied as a result of their knowledge.
Methods. Four groups of Egyptians considered to be at risk were selected and questioned by five simple questions, the 1st 3 tested their knowledge and the last 2 to assess any change of the practices related to the AIDS transmission. The 1st group (240 persons): consisted of Inmates on vice offences, the 2nd group (400 persons) of drug offenders, the 3rd (500 persons) consisted of young university students and the 4th (300 persons) consisted of workers in tourism industry. The common denomination in these groups is that they are particularly vulnerable either because of drug addiction or active sexual lives or contact with foreigners.
Results: are outlined in the following table.

		Heard of the disease		Know of the nature of the disease			Know of the modes of infection			Change of practices related to injections		Change of sexual practices	
		Yes	No	✓✓	✓	x	✓✓	✓	x	Yes	No	Yes	No
Inmates in vice offences	240	220	20	50	170	20	50	170	20	60	180	60	180
Inmates on Drugs offences	400	320	80	0	320	80	0	320	80	40	360	40	360
University Students	500	500	0	70	120	310	70	120	310	120	380	90	410
Workers in the tourism industry	300	300	0	100	0	200	40	140	120	70	230	70	230

N.B.: ✓✓ correct. ✓ = incomplete. x = don't know.

Conclusion. The study showed that the relatively educated Egyptians are better informed about the disease than those less educated who are at ever more risk. In all the groups studied the impact on the change of behaviour is not great. The study showed that selective campogning targeted at the more vulnerable groups is needed.

E.651

RISK FACTOR SCREENING: ATTITUDE OF BLOOD DONORS TOWARDS QUESTIONING SEXUAL BEHAVIOUR DURING DONOR INTERVIEW

Los, A.*; Achterhof, L.**; Tijmstra, T*; Suurmeyer, T; and Smit Sibinga, C.Th. * Div. of Medical Sociology, University of Groningen, NL **Red Cross Blood Bank Groningen-Drenthe, Groningen, Netherlands

Future extensions in definition of risk factors may require knowledge of risk or sexual behaviour of blood donors in the interest of safeguarding the blood supply from HIV contamination.
Objective: To investigate 1) donor attitude, and reactions to proposed questioning of sexual behaviour, 2) consequences for size of donor population and 3) under which conditions questioning sexual behaviour would be accepted.
Method: Postal questionnaire to random sample (n=600) from donor population (n=57,000) of R.C. Blood Bank Groningen-Drenthe, NL.
Results: Provided that privacy is guaranteed, majority (90%) of respondents show positive attitude towards questioning sexual behaviour, however, 30% expresses feelings of embarassment, 45% prefers communication with physician because of medical secrecy, 87% indicates that Blood Bank has the right to ask wahtever is justified in the interest of safe blood supply. When questioned on this subject, 5.4% would stop donating blood for privacy reasons.
Conclusion: Respondents show extreme tolerance to Blood Bank measures, provided that privacy is guaranteed, and requests regarding conditions and ambiance are respected. Only a small proportion of respondents indicates to stop donating blood. To generate acceptance of questioning sexual behaviour Blood Bank personnel should be trained to optimal interview techniques.

E.652

Title: A comparative KAB-P survey of ZAnzibar Urban and Rural Schools.

Authors: H.S.Nondo, H.S.Massor, H.M.Chwaya, O.J.Khatib
Ministry of Health, Zanzibar Tanzania, Zanzibar AIDS COntrol Program.

Objectives: (1) To determine the AIDS knowledge, attitudes, beliefs and sexual practices among Primary and Secondary school children aged 13-17 years. (2) TO provide guidelines for the development of correct information on AIDS, HIV infections, transmission and control methods.
Methods: A structured questionnaire was used on 269 Urban Primary and 174 Urban Secondary School Students as well as 92 Rural Primary and 179 Rural Secondary Schools. Students from the Randomly selected 5 Urban and 3 Rural Primary and Secondar Schools.
Results: 99% of the students had heard about AIDS (86% from RAdio, 45% from Newspapers and 21% from Schools). There is no Statistically significant difference between Urban and Rural Students knowledge about AIDS, its spread and presence in Zanzibar. Both Urban and Rural students thought that a student with AIDS or HIV infection should be expelled from school.

Conclussion: Though students (Rural and Urban) had heard about AIDS, yet they had misconceptions which should be addressed by a well planned IEC programme.

E.653

AIDS KNOWLEDGE, ATTITUDES AND BEHAVIOR AMONG FAMILY PLANNING CLIENTS: IMPLICATIONS FOR AIDS EDUCATION IN THE CARIBBEAN

Adu-Krow, W.; Barber-Madden, R.; Stein, Z.
MCH Program, Columbia University School of Public Health and HIV Center for Clinical and Behavioral Studies, New York, New York, U.S.A.

Objectives: Between male and female family planning clients, to determine differences in knowledge about AIDS transmission, perceived threat of disease and changes in contraceptive method.
Methods: Interviews of 242 family planning clients using a questionnaire of 25 open and closed ended questions, in seven Caribbean countries.
Results: The differences were that males were significantly more knowledgeable than females. In response to whether respondents asked a sex partner or had been asked by a sex partner to use a condom, females were significantly more likely than males to ask a sex partner. While 17% of all respondents reported having changed contraception method, only 5% reported actually having changed to the use of a condom.
Conclusion: While educational interventions may be effective in reducing misconceptions and increasing the likelihood of behavioral change, there is little evidence that these factors shape an individual's behavior. The paper will examine potential educational models to address these issues.

E.654

Knowledge, attitudes and beliefs of Greek people on AIDS

D.Agrafiotis, Elisabeth Ioannidi, R.Konstantinidis, J.Stylianou
Athens School of Public Health, Dept. of Sociology

Objective. To estimate knowledge, attitudes and beliefs on AIDS of the people in a high risk neighbourhood of Athens, namely Exarchia at first, where the pilot study was carried-out, aiming to cover the population of the metropolitan area of Athens in a full research financed by the World Health Organisation.
Methods. 128 questionnaires were completed by personal interviews on a randomly selected sample. Details about their demographic and scientific background along with questions on knowledge, attitudes and sexual behaviour related to AIDS were asked to be completed.
Results. Of the 128 people who completed our questionnaire 67 were males and 58 females 62,1% were higher education graduates, most of them self-employed and a high percentage belonged to the age group 25-34. Most of the people in our sample were well-aware on issues related to AIDS. 93,8% admitted having gained all information on AIDS through the mass-media. 56,3% claimed that they havent changed their sexual behaviour and only 13,3% are planning to make some changes in the future even though 52,3% consider AIDS a serious threat for their region. A small percentage insist on the use of condom. 83, 5% disagree to the proposal for the AIDS carriers/patients to be dismissed from their job or to be isolated despite their will (38%).
Conclusion. Our target population were highly knowledgeable about the disease, showing considerable sensitivity and tolerance towards those who are AIDS carriers or patients but had contradictory answers with respect to their own sexual behaviour.

E.655

COMPREHENSIVE HIV EDUCATION FOR UNIVERSITY STUDENTS IN A HIGH INCIDENCE AREA

Silver, Sylvia; Gerrity, E.T., and Akman, J.S.
The George Washington University Medical Center - Washington, D.C., USA.

Young adults are considered to be at risk for HIV infection due to their frequent sexual activity and experimentation with alcohol and drugs; college students attending a university in a high incidence area present a unique target audience for HIV education/prevention. Sixty-seven undergraduate students enrolled in a fourteen week, 3 semester hour credit course entitled "AIDS: The Epidemic" presented at the George Washington University in Washington D.C. This course covered technical, psychosocial, ethical, economic, legal and political issues related to HIV disease and presented information through lectures, audio-visuals, and panels of (1) individuals exhibiting high risk behaviors; (2) health care providers; and (3) the media. The largest percentage of majors represented were psychology, communications/radio/TV and premedicine; females comprised 80% of the class, and juniors were the largest group of students. Sexual orientation was given as 86.7% as heterosexual, 11.7% as homosexual/bisexual and 1.7% as no response. An assessment battery of attitude and knowledge surveys was given prior to, and at the completion of the course. Results showed a significant increase in knowledge ($p < .0001$), a more positive attitude toward people living with AIDS ($p < .004$), a decrease in homophobia ($p < .13$) and a reduction in anxiety over dying ($p < .06$). Recommendations for university HIV prevention programs include: (1) comprehensive coverage of the epidemic; (2) presentation of material relevant to peer issues; and (3) incorporation of panels of individuals representing the many facets of the HIV epidemic.

E.656

EVOLUTION D'UNE STRATEGIE D'INFORMATION NON GOUVERNEMENTALE

Frédéric Edelmann*, J-F Mettetal**, A Jourdan***, C Danton****, P-M Ramon****
* ARCAT-SIDA, CIVIS, ** Hôpital Necker, ARCAT-SIDA, CIVIS, *** Centre de formation des professions de santé, ****ARCAT-SIDA - ARCAT-SIDA 17, rue de Tournon 75006 PARIS
FRANCE

Objectif: Adapter les publications de l'association ARCAT-SIDA à des besoins exprimés et mesurables, dans un contexte national de sous-information.
Méthode: informatisation détaillée des demandes, analyse permanente des données, sondages, interviews.
Résultats: Les auteurs, à l'origine des premiers documents d'information parus en France (pour l'association AIDES), ont, depuis février 1985, mis au point un système informatisé d'analyse des demandes de documentation (la documentation est gratuite mais elle doit être demandée par écrit. Elle n'est jamais distribuée au hasard). Depuis 1987, dans le cadre de l'association ARCAT-SIDA, la part des demandes émanant des professionnels de santé ainsi que des professions-relais s'est accrue de façon importante. Dans un premier temps, cette augmentation a été attribuée à un bon fonctionnement des professionnels comme relais pour la diffusion de l'information. Des sondages limités mais répétés ont permis de constater que les demandes correspondaient paradoxalement aux besoins des demandeurs eux-même autant, voire plus qu'à ceux de leurs clientèles.
L'Association ARCAT-SIDA a, depuis diversifié, sa documentation. La brochure initiale a évolué au cours de ses éditions successives (aujourd'hui 40 pages) pour répondre principalement aux interrogations des professionnels de santé, même si elle continue d'être "destinée" à la population générale. Des brochures ou documents spécifiques ont été édités ou sont en cours de fabrication pour les médecins généralistes, les dentistes, les travailleurs sociaux, le personnel hospitalier, les kinésithérapeutes, etc.
Conclusion: la demande la plus forte provient des professionnels de santé et des professions relais (professeurs, éducateurs, travailleurs sociaux, etc.). L'effort d'information national, public et associatif, devrait s'adresser en priorité à eux afin d'en faire les relais d'une véritable campagne tous publics.

E.657

MILIEU SCOLAIRE ET PROBLEMATIQUE DU SIDA

Stéphane MANTION*, Bruno BONIFACE*, Bernard DUWEZ**

* ASSOCIATION DES JEUNES CONTRE LE SIDA - AJCS

** UNION DES SOCIETES ETUDIANTES MUTUALISTES - USEM, FRANCE

OBJECTIFS: Convaincre les structures officielles de l'Education Nationale d'organiser des séances de prévention du SIDA dans les lycées et collèges par des intervenants extérieurs formés pour cela avec un matériel adapté.

METHODOLOGIE: Après plus de 200 interventions spontanées en 1988, sur les demandes des enseignants, des infirmières scolaires, des parents et des jeunes, avec des documents spécifiques (vidéos et brochures), l'AJCS a pu effectuer un travail de pression auprès des autorités de l'Education, des parents d'élèves et de la presse pour généraliser ces séances.

RESULTATS: Une seconde étape est aujourd'hui franchie. Les interventions jusqu'alors sauvages, s'officialisent. Les demandes émanent des médecins scolaires , des chefs d'établissement et des autorités locales (rectorats).

CONCLUSION: Les réticences du milieu scolaire et de la communauté éducative à accepter des interventions extérieures ont été levées en douceur par une persuasion basée sur la confiance et la réponse aux besoins exprimés par les jeunes eux-mêmes.
Les associations ont eu un rôle précurseur de première importance, tant par la collaboration avec les partenaires que pour la conception des programmes.

E.658

IMPLEMENTING AIDS EDUCATION INTO THE CURRICULUM IN N.IRELAND

O'Donnell Fiona; Kilbane M P J, UNITED KINGDOM

Objective: To explore the feasibility of joint health and education initiatives to introduce AIDS Education into the secondary school sector in N.Ireland. This initiative occurred against a background of a conservative culture, a school system dominated by religious teaching and a reported antagonism towards homosexuality. There were no standardised sex education programmes in schools and in addition N.Ireland is an area with a low level of drug misuse and a low prevalence of HIV infection and AIDS.
Methods: An interdisciplinary approach was adopted in this initiative involving collaboration in a consultative process between health and education sectors, and the formation of a joint team to produce suitable health promotional materials.
Results: Unprecedented attendance for inservice training and use of material occurred in N.Ireland with some 76% of post primary schools in the Eastern Health and Social Services Board having one or more teachers trained in the programme. Further uptake occurred from schools for children with special needs and colleges of further education.
Conclusion: It is possible to implement AIDS schools prevention programmes even in a conservative and unfavourable climate in a population with low prevalence. The paper will detail the process by which this was achieved and the vital components of the programme.

E.659

"AIDS EDUCATION ON PSYCHIATRIC UNITS"

Polansky, Jerrold; Ponton, L.; McGill, C. U.S.A.

Most health care organizations have emphasized the vital importance of AIDS education for the general public. The AIDS policy for inpatient psychiatric units developed by the American Psychiatric Association addresses briefly the topic of AIDS education, recommending appropriate counseling for patients and staff. The rationale for educating psychiatric inpatients includes: eliminating HIV-related risk behaviors reported by psychiatric patients, addressing the needs of the increasing number of patients with AIDS hospitalized on psychiatric units, reducing fears and prejudice among patients and staff, and fulfilling a responsibility as health professionals to provide patients with information about HIV. We are presenting two models of AIDS education that target adult and adolescent psychiatric inpatients. The models are tailored to four psychiatric units affiliated with the University of California, San Francisco. Each one takes into account patient sociodemographic characteristics, level of psychiatric impairmetn and HIV-related risk behaviors. Descriptions of clinical interventions for the different models are presented.

E.660

PERFORMANCE STANDARDS FOR THE DEVELOPMENT AND EVALUATION OF SCHOOL HIV/AIDS EDUCATION CURRICULA FOR ADOLESCENTS

Yarber, William L., and Torabi, Mohammad R. U.S.A.

Objective. Most USA schools provide HIV/AIDS instruction for adolescents and either (1) utilize outside curricula, or (2) develop their own curriculum. Performance standrds against which current curricula can be evaluated or new curricula can be developed are needed. This paper describes the development of a performance standards checksheet.
Methods. Professional literature and health experts were used in developing the performance standards. Particular attention was centered on suggested content and pedagogical approach, including learning and instructional theory. A list of standards or evaluative criteria was generated, and arranged on paper as a checksheet.
Results. It was determined that the most ideal curriculum would have both the student and teacher guides. Seventy-two specific performance standards were generated for both guides. The student guide had ten major components: nature of HIV/AIDS, impact of AIDS, HIV transmission, individual HIV prevention, HIV control efforts, learning enhancement, learning domains approach, verbal quality, visual aesthetics, and tone of message. The teacher guide had six major components: HIV/AIDS school education, implementing the curriculum, learning activities, handouts, evaluation, and educ/infor sources.
Conclusion. Specific performance standards for school HIV/AIDS education curricula for adolescents can be generated and can assist educators in (1) determining the specific strengths and weaknesses of existing curricula, and (2) developing new curricula. Educators are encouraged to utilize the performance standards checksheet for both of these tasks.

E.661

FACE-TO-FACE: INTEGRATING PERSONS WITH AIDS INTO ADOLESCENT AIDS PREVENTION EDUCATION

Cranston, K.*; Yates, R.**; Wright, B.**
*Massachusetts Department of Education, Quincy, Massachusetts, USA,
** Health Care of Southeastern Massachusetts, Abington, Massachusetts, USA

Objective. To enhance the impact of AIDS prevention education efforts on adolescent audiences in public schools.
Methods. Persons with AIDS were recruited, screened, trained and fully integrated into a four-session AIDS prevention education module. Difficulties of community and staff resistance, parental approval, logistics and the limited personal resources of the persons with AIDS involved in the program were addressed. The person with AIDS presentation was preceded by two sessions on basic information and affective education about AIDS, and was followed by one session of emotional feedback from students.
Results. Anecdotal reports from educational faculty indicate that this format powerfully affects the attitudes and awareness of students. This may translate into true behavior change.
Conclusion. This model of AIDS prevention education may be easily replicated by other educational systems with minor modifications.

E.662

AIDS PREVENTION FOR ADOLESCENTS IN SCHOOL. DO SCHOOL PRINCIPALS PERCEIVE THE NEED?

Gutterman, EM; Walter, Heather J.; Beach, CE; Gladis, M and Ehrhardt, AA. HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute & Columbia University, New York, New York, USA.

Objective. The long-term goal of this project is to implement and subsequently evaluate an AIDS prevention program in the high schools which will favorably modify the behaviors that place students at risk for acquiring HIV. The school setting maximizes access to the adolescent population, but poses a host of challenges since a good fit between needs of the program and the school must be achieved. To determine the desirability of AIDS education, our first step was to target principals, the prime decision making group within the schools.
Methods. In June, 1988, an interview combining open-ended and structured items was administered by telephone to principals (or other high ranking school personnel) in Manhattan and Rockland County high schools.
Results. Our surveys indicate that principals view AIDS prevention as a high curriculum priority. There was total consensus that the goals of a school AIDS prevention program should include knowledge, attitudinal change, and drug abstinence skills. There was less agreement regarding the promotion of behavior change related to sexual abstinence and safer sex.
Conclusion. Principals generally concur with the need for an AIDS education program that would target knowledge, attitudes, and behavior. The commitment to AIDS education among teachers, parents, and students will be surveyed next.

E.663 AIDS AND THE MEANS OF COMMUNICATION: FROM HIGH RISK GROUPS TO HIGH RISK FACTORS; FROM HIGH RISK FACTORS TO AN UNDERSTANDING OF THE VIRUS.

Arredondo,C; Conde, F. , Coronado, A.*, Gil, E.*.
Ministery of Health.-Spain.

Objective. The manner in which AIDS and the AIDS problem has been put across to the general public has gone through several phases since the discovery of the virus in the early 80's. The major source of information has been the medical-scientific world and though the stress has changed from the defining of high risk groups to the present emphasis on high risk factors, AIDS has been and is still understood in pure epidemiological terms.
Conclusion. This paper analizes these sources of information,their underlying factors and proposes an alternative scientific discourse which would bring clear information on the transmission of the virus, a better understanding of this process and help change the ever increasing "quarantine" mentality towards the people afflicted with AIDS.

E.664 HEALTH AND MEDICAL APPRENTICESHIP PROGRAM OF AIDS RESEARCH

Clavreul, Genevieve M. World Immunological Network, Los Angeles, California, USA, Greenspan Michael, UC Berkeley Health and Medical Apprenticeship Program

OBJECTIVE To provide a support network to assist students and community members in the dissemination of AIDS information
METHODS This group research project will examine technical, social, poltical and econmic aspects of the global HIV epidemic The goal of the project is to produce a portion of an accurate, current information resource for use by AIDS educators and the general public
RESULTS It will provide trained and prepared students and community members, who are aware of the inner-workings of AIDS research and facilities
CONCLUSION There is a demonstrated need for an apprenticship program where interested students and community members can learn first-hand the inner workings of research In this way they will have been trained in many of the fundamentals, as well as exposing them to a field of work in which they have expressed interest In this way the end product would be dedicated professionals entering the field with prior knoweldge and therefore confidence in their ability to met the needs of AIDS research

E.665 EDUCATIONAL AND TRAINING STRATEGIES IN SÃO PAULO STATE, BRAZIL.

Fernandes, M.E.: Inglesi E.: Ferreira A.C.: Grandi J.L.:Abbud,N. .
Centro de Referência e Treinamento em Aids - São Paulo, Brazil.

The state of São Paulo, Brasil, has a population of 33 million. From 1980 until December 1988, 3213 Aids Cases were reported to the Health department.
In 1987 was organized the first massive Campaign with 12 million pamphlets, 1.5 million posters, 5.000 bilbords, 100.000 guidelines for infection control, 4 videos for TV, 4 spots for radio.
Apart from the massive programs and Campaigns the Educational and Training UNIT on Aids,, from secretary of Health, developed strategies of training health care providers and community leaders in order to be those who will train and inform others.
During 1988 we trained 2110 community leaders to give Aids information in the frontline.
Conclusion: The person to person information on Aids is most effective way of prevention specially in our region which is full of contrasts of all sorts cultural, educational, economical and Social.

E.666 EFFECTS OF AN EDUCATIONAL CAMPAIGN TO REDUCE BLOOD TRANSFUSIONS IN CHILDREN IN KINSHASA, ZAIRE

*Davachi, Farzin, *Nseka, M., **N'Galy, B. and *Mann, J.M.
*Department of Pediatrics, Mama Yemo Hospital, **Ministry of Health, Kinshasa, Zaire and *WHO, Geneva, Switzerland.

Objective: To evaluate the effectiveness of an educational campaign to reduce the number of blood transfusions and thereby reduce the transmission of AIDS.
Methods: An investigation carried out at the Department of Pediatrics revealed that malaria induced anemia was the major cause of transfusion. Nevertheless, children with a hemoglobin as high as 11 gm% have been referred for transfusion to Mama Yemo Hospital, the major transfusion center in Kinshasa. A survey at its blood bank revealed that 6.3% of all donors were HIV seropositive, and 55% of seropositive children, 2-12 years old, have received previous transfusions. Therefore in order to reduce the number of transfusions, an intensive campaign on its inherent risks was launched. Conferences were organized for the Zairian Society of Pediatrics, for the faculty and housestaff and guidelines were set. Based on hemodynamic evaluation, transfusion were reserved for children with a hgb. of less than 5 gm% if there were signs of hemodynamic compromise. In addition an HIV screening unit was installed at the blood bank.
Results: Dramatic results followed the campaign. There was a 72% decrease in the number of transfusions from 16,352 in 1986 to 4,531 in 1987 with no increase in mortality. Transmission of other endemic infections such as malaria, cytomegaloviruses and hepititis B were proportionately reduced.
Conclusion: A worldwide educational campaign is required to reduce the number of unnecessary transfusions. This coupled with HIV screening tests prevents the risk of HIV transmission by this route.

E.667 PATIENT OPINIONS ABOUT DENTISTS AS AIDS EDUCATORS.

Gerbert, Barbara; Maguire, B.; Sumser J. and Spitzer, S. University of California at San Francisco, California, United States.

Objective. There has been little discussion about whether dentists would be appropriate disseminators of HIV information. We wanted to determine if patients would accept dentists as HIV educators and if patients have experienced dentists acting in this role as part of their response to the HIV epidemic.
Methods. Telephone interviews were conducted in July and August 1988 with 2000 English-speaking, United States adults, using a representative national sample generated by random digit dialing. The response rate was 75%. The denominator for the data reported below is all those who have received dental care in the past five years (n=1825; 91% of sample).
Results. Only 13% of the respondents had discussed AIDS with their dentist; in 80% of these cases, the conversation was started by the patient rather than the dentist. Twenty-one percent of respondents wanted to discuss AIDS, 49% did not care, and just 30% "would prefer not to talk" about it. A majority of patients were "very" or "mostly" comfortable with the idea of discussing AIDS (86%) or intravenous drug use (80%) with their dentist, but a minority (45%) felt that way about discussing their sexual behavior. Of those who were willing to discuss AIDS, 35% believed patients themselves should start the conversation; the rest thought the dentist should (35%) or that it did not matter who began the conversation (30%).
Conclusion. These data show that dental patients are willing to use their dentists as information resources concerning HIV. On the topic of sexual behavior, however, patients were more reticent. We believe patients would be more receptive to dentists providing patients with educational information on HIV and suggest that dentists initiate such discussions with patients.

E.668 A MODEL HIV EDUCATION/PREVENTION PROGRAM FOR A PREPAID HEALTH PLAN

Schram, Neil, M.D.*, Cunco, W., Ph.D.** - *Southern California Permanente Medical Group, Harbor City, California, USA. **Kaiser Permanente Medical Care Program, Oakland, California, USA.

The Kaiser Permanente Medical Care Program is a group practice prepaid health plan with approximately five million members in twelve regions of the United States. An Inter-Regional (nationwide) AIDS Committee has been formed to respond to and plan for issues that the AIDS epidemic presents to complex health care systems like ours. The Education and Counseling Subcommittee has developed a model program to educate, reduce fear, and overcome denial; to allow our employees, physicians, and members to prevent the transmission of HIV; and to deal more effectively and humanely with the AIDS epidemic.
Three specific populations have been targeted for education and counseling:

1. Kaiser Permanente employees and providers (including physicians).
2. The general patient membership.
3. Patients and employees who practice behaviors that put them at risk for HIV infection.

A four-step process for AIDS prevention in the context of ambulatory health care will be presented:

1. Identifying members who practice high-risk behavior.
2. Providing same day information.
3. Providing risk reduction education.
4. Implementing risk reduction counseling programs aimed at gay and bisexual men, IV drug users and their steady sexual partners, hemophiliacs and their steady sexual partners, adolescents, and the steady sexual partners of anyone known to be infected with HIV.

E.669

EVALUATION OF THE IMPACT OF AIDS EDUCATION

Skelly, Regina R.; Sanderson, R.; Grinde, K.; Daniell, F.D.
American Red Cross and Navy Environmental and Preventive Medicine Unit, Naples, Italy.

Objective. The potential severity of HIV infection has demanded aggressive intensive and effective educational programs to limit the spread of disease This study evaluated the level of knowledge concerning HIV transmission factors in a diverse overseas American community, and established a methodology to evaluate which educational activities could result in modification of high risk behavior.
Methods. An educational program was designed to present information on the HIV epidemic. Prior to and immediately following the program, a questionnaire was administered to assess levels of awareness concerning transmission and non-transmission factors for the HIV virus.
Results. The study group of 139 predominantly young (20-30 year old) individuals were all aware of the principle transmission factors; however, 70% had significant misconceptions related to the infection and disease process, including blood donation (38%), insect bites (33%), and kissing (30%). Initial data indicate that certain channels of communication are preferred by population subgroups; and specific formats are more likely to improve levels of knowledge and actually result in changes in behavior.
Conclusion. While the majority of persons are aware of the transmission factors related to HIV, a significant number of individuals provided misinformation. Educational programs must be developed to provide sufficient, comprehensive information; targeted to specific groups to result in behavior modification; and evaluated to document effectiveness.

E.670

CONDOM USE ASSESSMENT AND INTERVENTION STUDY: A NEW TOOL FOR CONDOM PROMOTION

Smith, William*; Pareja, Reynaldo**; *AIDSCOM, Washington, D.C.; **AIDSCOM, Dominican Republic

Objective. To determine level of correct application and removal of condom among targeted populations.
Methodology. Using an observation protocol respondents are asked to place on a surrogate object a condom. The researcher, through observation, records data about placement and removal, noting such items as how package opened, whether/how condom unwound, whether condom breaks due to respondent error etc. Observation protocol is followed by brief KAP Survey.
Results. Findings in the Dominican Republic indicate that basic training in the fundamentals of correct placement and removal are required. Specific findings will be cited (n=100) - comparison will be made with results from Jamaica and Trinidad.
Conclusions. As materials are developed to encourage condom use, a return to basic knowledge gathering may be called for. The hypothesis that knowledge of the basic placement and removal procedures is universal may require further exploration.

E.671

CORRECT CONDOM USE: AN ASSESSMENT AND INTERVENTION STUDY AMONG SEXUALLY ACTIVE MEN IN TRINIDAD AND TOBAGO,

Woods, William.*; Cleghorn, F. **; Mahabir, B. ***; Helquist, M.*; Renaud, D.**
*AIDSCOM, Washington, D.C.; ** Caribbean Epidemiology Centre, Trinidad and Tobago;
*** Queens Park Counselling Centre and Clinic, Trinidad and Tobago.

Objective. To assess the degree of correct condom use among sexually active heterosexual, bisexual, and homosexual men in Trinidad and Tobago and to compare different approaches to teaching correct use.
Methods. Contact investigators at an urban STD clinic invited 200 male clients to participate voluntarily in a condom use study, Selection based on client availability. An initial assissment of knowledge and use of condoms was followed by 1 of 2 interventions and an immediate post-test. Intervention#1 had the interviewer model correct condom use with a surrogate object and #2 involved providing a brochure with pictorial explanations of condom use procedures.
Results. Study in progress; but pilot study indicated men knew basics about putting condoms on but were less clear about important ways to avoid condom breakage. Interventions with immediate consultation helped increase skills considerable.
Conclusion. Clients at risk for HIV need information and skill-building for correct condom use. Which teaching intervention proves more effective remains uncertain; this study may help indicate whether mass produced and distributed "How to use condoms" brochures are useful for increasing correct condom use.

E.672

THE CELEBRATION OF LIFE: TEN BASIC GUIDING PRINCIPLES FOR AIDS PREVENTION IN THE DOMINICAN REPUBLIC

De Moya, E. Antonio; Guerrero, E; Belliard, M; Peña, C; Garris, I.; Domínguez, L.
PROCETS, Ministry of Public Health, Santo Domingo, Dominican Republic.

Objective. To present the ten basic guiding principles for AIDS prevention developed by PROCETS, and to analyze the supporting empirical evidence accumulated from 1985.

Methods. Principles are discussed together with the main supporting findings derived from CAP studies and educational research.

Results. Key principles that have proven effective for AIDS prevention are: 1) Enhance the target-audience's self esteem; 2) Speak to the heart of the targets; 3) Emphasize the value of health, love and life; 4) Increase awareness of one sexual contact infectiousness; 5) Promote a high perception of the preventive value of condom use; 6) Educate the population about other STD; 7) Insist on mother-infant transmission; 8) Keep high levels of perceived threat of AIDS in women and low levels in men; 9) Create awareness of individual responsibility for contagion; 10) Always speak of hope, joy of live and power to control AIDS.

Conclusion. High standards of acceptance and responsiveness to the Program - have been reached through an approach that deemphasizes disease and death - while promoting health, love and life.

E.673

LE CENTRE REGIONAL D'INFORMATION ET DE PREVENTION SIDA (CRIPS), PARIS

JAYLE D.*, DAB W.**, FERRY R.** FRANCE

*CRIPS
**Observatoire Régional de Santé

Objectif. Centre de ressources pour la prévention du SIDA en Ile-de-France destiné aux professionnels de la santé et de l'éducation. Lieu d'échange et de rencontre pour les acteurs de santé au sein de la région la plus touchée par le VIH en Europe. Une initiative du Conseil Régional d'Ile-de-France.
Méthodes.
1- Recenser les actions de prévention, publiques ou privées, entreprises dans la région.
2- Rassembler et classer par thème la documentation sur la prévention (en collaboration avec UCL Belgique).
3- Conseiller sur le plan méthodologique ceux qui montent des projets de prévention.
4- Organiser des formations pilotes.

Résultats. Depuis son ouverture en novembre 1988 :
- La documentation représente plus de 2.000 références indexées accessibles à distance et 100 films vidéo.
- la lettre du CRIPS est adressée périodiquement aux professionnels.
- des formations pilotes pour des centres de dépistage HIV, médecine préventive universitaire, PTT, policiers ont été organisées.

Conclusion. Le CRIPS est une structure pilote para-publique. Lieu de rencontre pour les associations et les professionnels, destiné à favoriser les initiatives et la circulation de l'information.

E.674

WORLD AIDS DAY ACTIVITIES AND THEIR SIGNIFICANCE FOR AIDS PREVENTION IN CATALONIA.

Wohlfeiler, Dan;* Segura, A;** Procupet, A.** FRANCE

Objective: To initiate World AIDS Day activities in Catalonia, and determine their significance for future AIDS prevention efforts.
Method: The government, Church, citizens' organizations and mass-media all actively partcipated in World AIDS Day activities. These included distributing information, releasing balloons to commemorate those who had died of AIDS, a condom party at a gay discotheque, and documentary and feature film premieres at local cinemas. Mainstream, religious and gay media gave extensive coverage with features and scientific articles. Direct advertising was kept to a minimum.
Results: This was the first time a multisectorial AIDS prevention effort took place in Catalonia. Success would have been enhanced by instituting a coordinating team. Potential new community opinion leaders were identified and recruited. By focusing on media coverage, costs were kept low.
Conclusion: World AIDS Day provides an opportunity for education and coalition building among otherwise unaffiliated members of the community. It also serves to identify community participants necessary to maintain high levels of AIDS awareness throughout the year.

E.675

THE NEED FOR PSYCHOSOCIAL EMPHASIS IN ACADEMIC COURSES ON AIDS

Ziffer, Albert*; and Ziffer, J.*
*Rollins College, Winter Park, Florida 32789, U.S.A.

Hypothesis. Although the number of educational programs concerning AIDS has multiplied significantly during the past 3 years, frequently, more attention is paid to the epidemiology and clinical aspects of the disease rather than the psychosocial issues which need equal or greater emphasis.
Method. To evaluate this premise pre/post tests on attitudes were administered to two groups of students enrolled in one semester, intensive courses on AIDS. One course taught only facts and the other taught facts, values clarification, and attitudinal change of biases.
Results. The course in which medical and psychosocial aspects of AIDS was emphasized resulted in significant attitudinal change among the students. The post course questionnaires revealed a markedly more ethically responsible and compassionate attitude toward persons with AIDS than existed prior to the course. The course which taught only facts resulted in no statistically significant attitudinal change.
Conclusion. If academic courses on AIDS are to be effective in disseminating information and in increasing compassion and reducing biases of students, then the teaching model for such course work must address the psychosocial issues as well as the scientific facts.

E.676

EVALUATION OF THE NIDA SPONSORED TRAINING OF TRAINERS PROGRAM ON AIDS AND THE IV DRUG USER

Ashery, Rebecca S.
National Institute on Drug Abuse, Rockville, Maryland USA

Objective. The purpose of the study was to conduct a followup evaluation on the NIDA train the trainers (TOT) program on how to deliver the NIDA AIDS curriculum to drug treatment personnel.
Methods. A mail questionnaire was sent to participants of 16 TOT workshops conducted for selected individuals from 14 states and the District of Columbia. The self administered questionnaire was designed to assess the usefulness of the training, the extent to which it increased their skills in specific areas and their AIDS training activities since the TOT and additional technical assistance needed from NIDA.
Results. Out of 152 respondents 93% indicated that the overall effectiveness of the TOT course was excellent or good. Nearly 75% of the respondents had delivered training in the six months after they had received the TOT. Less than 20% of the respondents followed the NIDA curriculum exactly, changing either the time schedule or adding and deleting units.
Conclusion. It was estimated that 16,500 people had received some training by graduates of the NIDA TOT workshops. By most factors considered in the survey, the TOT program is considered a success.

E.677

FEAR AROUSAL AND SHOCK TACTICS DO THEY WORK?

Lorraine Sherr - St. Mary's Hospital/Roehampton Inst. UNITED KINGDOM

Objective:- To evaluate the use of fear-arousal in AIDS Campaigns.

INTRODUCTION:- Fear arousal for behaviour change has little recorded success. The Govt. Health Education Campaign on AIDS used fear messages targetted at spread via contaminated needles. Is fear arousal effective? If not is this because the recipients are not frightened (& hence greater fear should be induced) or is the technique based on dubious theory and of limited use (& hence should be abandoned)?

METHOD:- 111 subjects (52 consecutive Drug Dependence Unit attenders in the area of highest U.K. HIV incidence & 59 students in the same area) had anxiety level measured pre and post exposure to the posters (visual) and television adverts (audio-visual) material to monitor anxiety change. Attitudes, drug using and sexual behaviour and perceived personal risk was monitored.

RESULTS:- The DDU group were significantly more anxious than students ($p>.001$) as a group. Fear messages significantly increased in students ($t=3.8$ $p=.0001$) but had no impact on drug users. Visual and audio-visual material was inconsequential in contributing to the effect. Drug users were less likely to rate material as realistic. Likelihood of changing sexual behaviour was low for both groups (+ ⅓ had multiple sexual partners in the proceeding six months). Perceived personal risk was low (42% DU & 24% Stu felt at no risk). Many students have taken drugs in the past six months (72% pot, 20% harder, 2.3% I.V.). 85% DU and 83% Stu stated that the HEC had not changed their drug using behaviour. Not one subject thought the message was aimed at them. Both were worried about AIDS (mean 3.5 and 4.1 on 7pt scale). CONCLUSION:- Fear arousal has limited use.

E.678

HIV COUNSELING AND TESTING IN PRIVATE MEDICAL PRACTICE IN NEW JERSEY

Ose, Molly*; Sanders, E.*; Kyllingstad, A.*; French, J.*; Costa, S.*; Davidson, R.**
*New Jersey State Department of Health, Trenton, New Jersey, USA; **Academy of Medicine of New Jersey, Lawrenceville, New Jersey, USA

Objective. To assess the extent to which HIV counseling and testing exists in private practice, solicit information concerning the extent to which HIV counseling and testing sites (CTS) are being utilized for referrals, and the perceived need for continuing medical education related to HIV infection.
Methods. In September 1988, a nine point questionnaire printed on a self-mailing postcard was sent to approximately 10,000 physicians in New Jersey. Of 2,048 responses 2,017 questionnaires were screened for obvious errors, transcribed, and entered into an SAS data set. All analyses were carried out using SAS.
Results. Physicians indicated that they manage only about 40% of post-test counseling themselves, in contrast to about 68% of all other counseling and testing activities. The 597 physicians who reported receiving CME credit on AIDS reported significantly increased counseling activities, with the largest relative increase in post-test counseling. Of those physicians who refer patients for counseling and testing, 48% refer to local infectious disease specialists, while only 20% refer to local CTS. Furthermore, only 13% of respondents could accurately identify their local CTS.
Conclusion. The response rate of 20% suggests that the subject matter is considered to be important by a significant segment of the medical community. Very few physicians, however, even those with AIDS patients, are aware of the New Jersey CTS. Taking CME credits in AIDS significantly increases personal involvement both in the treatment of AIDS patients and in the provision of pre and post test counseling. Information obtained via this survey is being used to plan future CME curricula.

E.679

E.680

DIFFERENCE D'EFFICACITE DU SOUTIEN ASSURE PAR UN OU DEUX VOLONTAIRES.

LEMOUX, Yvon.
Association AIDES, Comité de Paris, France.

Objectif. Evaluer l'efficacité du travail d'accompagnement dit "en binôme". Il s'agit du soutien assuré par deux volontaires visitant individuellement la personne atteinte de SIDA.
Méthodes. Etude comparative réalisée sur 100 dossiers (période de référence : mars 86 à janvier 89) de suivis en binômes et de suivis individuels.
Répartition : 50% en binômes
50% en individuels
Principales sources d'information : comptes-rendus écrits par les volontaires après chaque contact, témoignages de volontaires et de personnes suivies.
Résultats. Les arrêts de suivis assurés par un seul volontaire pour des raisons non expliquées (autre que le décès du malade ou sa volonté clairement exprimée de l'arrêt de l'aide) sont beaucoup plus nombreux qu'en binômes :
50% des cas en individuel
10% des cas en binôme
Conclusion. Il est nécessaire de développer ce type de prise en charge à deux, afin d'améliorer le service offert d'une part et protéger les volontaires d'autre part. Cette technique de co-responsabilité peut-être également envisagée pour l'animation de groupes de volontaires.
Enfin, le principe du suivi en binôme paraît la meilleure approche en cas de prise en charge de toxicomanes.

E.681

AIDS KNOWLEDGE OF MALE STUDENTS FROM A SELECTIVE U.S. PREPARATORY SCHOOL. Genser, Sander*; Genser, J.**; Haverkos, H*. *National Institute on Drug Abuse, Rockville, Maryland, U.S.A.; **Potomac, Maryland, U.S.A.

Objective: To assess knowledge of AIDS and AIDS transmission in a group of male students in a selective independent non-parochial secondary school in the U.S. in comparison to a national sample of adults. Methods: Questions covering basic biomedical facts about AIDS and AIDS transmission were culled from the National Health Interview Survey (Natl Ctr for Health Statistics). The resulting questionnaire was administered to entire classes in the 5th through 8th grades (ages 10-15) and a smaller sample in the 10th grade, for a total N=240. Results: In this unusual sample of students, the 50th percentile of students tests at the 90th percentile for verbal ability and the 94th for mathematical ability by national norms, over 90% of families pay the annual tuition of over $8000/ year and 99% of students (from the school) have consistently gone on to selective colleges upon graduation. Each class scored at least 74% correct on the factual questions with a gradient of increasing knowledge with grade level apparent only in questions about central nervous system effects of AIDS. Overall knowledge matched or exceeded that found in the general population of adult males. However, students in the lower grades felt that they knew less about AIDS, had a greater percentage of "don't know" responses and showed a wider (within grade) variability of responses. Conclusion: In this subpopulation, extensive AIDS knowledge asymptotes below the age of expected increasing risk of exposure. However, one cannot assume that this knowledge will translate to rational risk reduction behavior.

E.683

MEDICAL CENTER RESPONSE TO HIV POLICY ISSUES
Fine, Richard, M.D.; Miller, D., M.P.H.; Luce, J., M.D.; Sowa, P., M.H.A. S.F.General Hospital, San Francisco, CA, USA

Objective. To document the response of an urban public medical center in addressing HIV issues related to both patient care and health worker safety.
Methods. The Executive Committee established a multi-disciplinary Task Force to document HIV related problems. The Task Force addressed its response in context of community practice, ethical and political issues and maintaining safe, quality care. The first project was the institution of a Counseling and Testing Service for patients. The Service provides counseling for patients, consultation to houseofficers and attending physicians and training in appropriate counseling. The Service also implements the testing and counseling protocols for health care workers who have experienced a blood or body substance exposure. Once the systems for HIV counseling and testing were in place, the Task Force addressed the financial impact of HIV programs that ensure health worker safety. This evaluation looks at both the direct and indirect costs of HIV programs at San Francisco General Hospital.
Results. The Task Force has established a common knowledge base and common experience in addressing HIV related policy issues. The findings of this group led to shaping internal hospital policy in addition to supporting university and legislative change.
Conclusion. The establishment of a multi-disciplinary team to identify and address HIV related problems completed its charge. The work of this group continues on quality of care, policy and budgetary decisions.

E.685

E.682

REPORT OF THE UNITED STATES DEPARTMENT OF HEALTH AND HUMAN SERVICES WORK GROUP ON PEDIATRIC HIV INFECTION AND DISEASE: A NATIONAL AGENDA

Novello, Antonia; Wright, A.; and Willoughby, A.

National Institute of Child Health and Human Development,
National Institutes of Health, Bethesda, Maryland, U.S.A.

Objective. To determine how the U.S. Department of Health and Human Services could respond most appropriately and effectively to the challenge of increasing numbers of children with HIV disease.
Methods. An interdepartmental group of agency experts reviewed and defined the population at risk, the research and treatment modalities, potential gaps and overlaps in the areas of treatment, research, availability and adequacy of benefits, financing of care and services. Further analyses were submitted and subdivided into four areas: research, care, financing of care, and prevention.
Results. Activities requiring immediate action as well as those requiring further study were identified and targeted for action.
Conclusion. With HIV disease rising rapidly and becoming increasingly recognized as one of the leading causes of death among children; manifesting itself as a complex entity different from that of adults, specially tailored approaches encompassing research, care, financing of care, and prevention need to be developed.

E.684

QUALITY OF CARE REVIEWS FOR PERSONS WITH AIDS AND HIV RELATED ILLNESSES IN NEW YORK STATE
Rango,Nicholas,M.D.*;Feldman,I.*;Rodriguez,H.,M.D.*;Anderson, E.*;Wielk,C.**and Burke,G,M.D.*.*New York State Department of Health,AIDS Institute,Albany,New York,**New York Statewide PSR Council,Inc.,New York,New York. U.S.A.

Objective.To describe quality indicators among 476 symptomatic HIV patients in 13 AIDS Center Hospitals.
Methods.AIDS Centers routinely receive scheduled quality of care reviews conducted by the AIDS Intervention Management System(AIMS).The reviewers utilize quality of care guidelines developed by AIDS Center criteria workgroups.These workgroups,have also been established to develop criteria for nursing,case management,pediatric,obstetrical and ambulatory care. Physicians with experience in the care and treatment of AIDS patients are selected to the committee and are also utilized as reviewers resulting in a peer review process whereby AIDS Center physicians review the quality of care provided by other AIDS Center physicians.
Results.A summary of onsite review experience indicated that 11.7% of the cases reviewed had quality of care issues identified.The most commonly identified quality of care issues were delayed,inappropriate or inadequate consults(17%),tests(16%),and procedures(14%).
Conclusion.The Statewide Peer Review process has succeeded in developing clinically relevant quality of care standards.Also it has provided an important forum for discussion between AIDS clinicians,participating hospitals and the New York State Department of Health.This cooperated developmental model will be applied to other care settings in New York State.

E.686

MARGINALIZATION OF GAY MEN IN AIDS FUNDING AND PROGRAMS
Krutchey, Chuck; Walsh, Kevin
San Francisco AIDS Foundation, U.S.A.

Gay men and other men who have sex with men are the most disproportionately affected population for acquiring HIV infection and disease. Through misinterpretations of available data, and prejudice, a dramaticly shrinking proportion of funds and programs are being directed toward this population. The available data, based on cohort studies in large urban epicenters of the epidemic, cannot be easily generalized to other gay men. Their demographic profile, sensitization effects, unique geography, socioeconomic status, and personal motivation to be involved in long term studies makes them unlike the average in many ways. The high seroprevelance in urban areas among these men, and the problem of relapse to unsafe sex, make the assumption that the epidemic is over a highly dangerous one for the public health. Misinterpretation of this data also frequently serves as a cover for a prejudice to not serve this population.

E.687

A.I.D.S. THE DEVELOPMENT OF SCHOOL BOARD POLICY ON SENSITIVE ISSUES

Conrod, G. Scott, Adams, S., and Hanafi, L.
Laurenval School Board, Duvernay, Laval, Quebec, Canada.

Objective: To present to participants the process the Laurenval School Board used in establishing a policy on A.I.D.S.
Methods: To establish a school board policy on A.I.D.S., a committee including medical expertise prepared a document which was subjected to consultation with the parents, committees and teacher councils of 19 schools.
Results: The policy, which attempts to teach appropriate behaviour, while respecting individual rights, was accepted by an entire community without rancour, division. The process raised everyone's awareness in a period of relative calm. We are now prepared should an employee or a child acquire A.I.D.S.
Conclusion: The process establishing a policy on A.I.D.S. is in and of itself an education for all involved.

E.688

IMPLICATIONS OF FAILURE TO DEVELOP COMPREHENSIVE POLICY RE AIDS/HIV

Suki Terada Porta Director,Family Health Project/ Vice Chair, National Minority AIDS Council N.Y.C.,N.Y.S., USA.

N.Y.C. is the epicenter of AIDS as well as pockets of poverty as Harlem with an Infant Mortality Rate of 26.7 compared to N.Y.C.'s overall 12. As of 1/12/89 59% of the cumulative 18,116 adults are Black, Hispanic, Asian and Native American CDC defined AIDS, and of these cases, 84% of the women are also minority (2,249). Peds cases are 361 of the total 402 with a Black or Hispanic mother. The probable transmission and risk factor of both adult and peds are drug related. To extrapolate out the adolescent cases - it is for males 13-19:25 cases, females 13-19: 10 cases. Of the 7 to 10 year incubation rate, today's cases are males 20-29:2,272, females 20-29:539. NYC Health Dept. estimates of 50,000 HIV+ females would translate to predict if they are primarily Black and Hispanic and mirror images of present cases, each will have a majority drug related risk factor, primarily low income and limited education with 1-4 children. Low birth weight and other indicators of poverty status (less than 13% have no refrigeration for infant formula)arrival at hospital to give birth with little or no prenatal care prevents information re HIV risk factors. Implications for comprehensive planning for prevention that is class, income,education and culture/race/ethniculture specific are seen in failure at present to cope with CRACK cofactor, the spectre of 50,000 HIV positive women leaving as orphans from 50,000 to 300,000 healthy, emotionally unstable children.

E.689

LESSONS FROM FAILED TRIALS: A COMMUNITY RESPONSE

Eigo, James; Kirschenbaum, D. and Long, I. AIDS Coalition to Unleash Power, New York, New York, USA.

Objective. To discuss the randomized controlled clinical trial in an ethical context.
Methods. Specific trials will be presented and the ethical dilemmas faced by subjects will be evaluated.
Discussion: Ethical abuses in trial design have led to slow enrollments, high dropout rates and inconclusive data in many HIV drug studies. From an ethical standpoint, participation in a controlled clinical trial is often an HIV-infected person's only way to get a particular treatment. Research protocols must be understood as a form of treatment. U.S. AIDS Clinical Trial Group trials 005, 036 and 019 will be discussed.

E.690

AIDS DRUGS AND THE POLITICS OF BIOMEDICINE

Eigo, James and Harrington, M. AIDS Coalition to Unleash Power, New York, New York, USA.

Objective. To place biomedicine and AIDS drugs in the U.S. in its political context.
Methods. An analysis of the U.S. biomedical research budget, specific AIDS-related clinical trial protocols sponsored by the National institutes of Health and private drug companies and drug regulations as they have been applied to experimental AIDS drugs.
Results. 1) In the U.S., most people with AIDS are from populations that have been historically marginalised, so there has never been broad-based political pressure to fund AIDS research. 2) Scientists do research to advance scientific inquiry; this favors elegant solutions to scientific problems over the development of practical therapies. 3) High-tech companies favor high-tech solutions; i.e. knockout cures and vaccines, which means writing off just about everyone who has AIDS now.
4) Regulators only accept data from controlled clinical trials, so a drug proven effective after treating thousands of people on a "compassionate use" basis has been denied marketing approval.
Results. The pragmatic politics of influential constituencies, the academic politics of basic research, the market politics of drug companies and the bureaucratic politics of the regulators all delay the delivery of effective therapy to people with AIDS.

E.691

HOMELESSNESS AMONG HOSPITALIZED PATIENTS WITH AIDS-RELATED COMPLEX (ARC) IN NEW YORK (NYC)

Ramon A. Torres*; Mani S**; Martin M*; Brickner PW*. *St. Vincent's Hospital (SVH) and Medical Center; **Mt. Sinai Hospital and Medical Center, New York, N.Y. USA.

Objective: To determine the prevalence of homelessness among hospitalized patients with ARC over a 6-year period in a community hospital in NYC; and compare the characteristics of homeless patients to those of non-homeless patients with ARC.
Methods: Retrospective review of the medical records of all patients with ARC (total= 160) admitted to SVH between 1981-1987.
Results: Twenty-four percent of patients with ARC (38/160) were homeless, i.e. were living in shelters or streets, at time of admission to the hospital. Homeless patients had significantly higher rates of intravenous drug use (IVDU), Mycobacterium tuberculosis (MTB) and bacterial pneumonia (BP), than non-homeless patients. More homeless patients signed out AMA (SOAMA) or were lost to follow-up (LTFU) and the majority were discharged to shelters or streets (D/C S-S):

	Homeless No.	(%)	Non-Homeless No.	(%)	P Value
IVDU	22	(58)	29	(24)	<0.001
MTB	13	(34)	11	(09)	<0.001
BP	25	(66)	51	(42)	<0.01
SOAMA/LTFU	08	(21)	15	(12)	<0.20
D/C S-S	25	(66)	03	(02)	<0.0001

Conclusion: Because of a high incidence of IVDU, MTB and BP among homeless patients with ARC, who are likely to progress to full-blown AIDS, homelessness should be addressed in these patients prior to hospital discharge, in order to halt transmission of HIV through needle sharing or airborne transmission of opportunistic pathogens in shelters or streets.

E.692

TREATMENT IND AND AIDS DRUGS: A BROKEN PROMISE

Eigo, James; Long, I; McCarthy, M.; Harrington, M; Kirschenbaum, D. AIDS Coalition to Unleash Power, New York, New York, USA.

Objective. To evaluate the success of the Food and Drug Administration (FDA)'s Treatment IND program in delivering AIDS-related drugs to HIV-infected people. Method. An analysis of FDA regulations governing Treatment IND (1987) and streamlining drug approval (1988), an evaluation of protocols governing the release of the two AIDS-related drugs available under Treatment IND and interviews with FDA officials. Results. The FDA's Treatment IND program, codified in June 1987, was designed to make drugs of some proven efficacy available before their marketing approval to people with serious illnesses or life-threatening conditions. Two AIDS-related drugs are available under Treatment IND. The FDA drew the original protocol for ganciclovir so narrowly that community organisations threatened suit; as a result, the FDA capitulated and broadened the protocol. Ganciclovir is available under a Treatment IND protocol that is one of three protocols replacing a compassionate use protocol: the drug is less available under the Treatment IND program than it was before it was granted this status. Recent FDA regulations state that Treatment IND will bridge the time from the end of a clinical trial to the final decision on marketing approval, which is a severe narrowing of the program's original purpose. Conclusion. Treatment IND initially promised the early release of effective drugs to HIV-infected people; however, the program has actually restricted access to promising therapies.

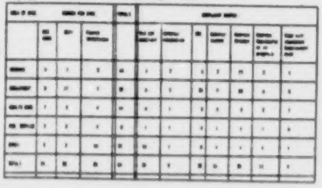
E.693

AIDS DISCRIMINATION IN CANADA

Westwood, John T. Executive Director, B.C. Civil Liberties Association, Vancouver, British Columbia, Canada

Objective. To determine the range and extent of unfair discrimination in Canada against persons who are, or who are feared to be, infectious with the AIDS virus.
Method. Questionnaires were sent to all agencies likely to receive complaints, posters soliciting anonymous complaints were distributed, and contact made with advocates for persons with AIDS.
Results. 84 reports have been received, including oral reports and cases reported in the media. Two areas of discrimination are discussed in some depth. In one, access to dental care, the investigation indicated that some progress has been made in reducing unfair discrimination. In the other, treatment of inmates, there has been little progress.

Conclusions. Although AIDS and HIV seroprevalence are, as disabilities, included as prohibited grounds of discrimination under federal and provincial Human Rights Acts, there remain areas in which unfair discrimination continues unabated.



E.694

AIDS AND HEROIN: STRATEGIES FOR CONTROL

Kleiman, Mark*; Mockler, R.
*John F. Kennedy School of Government, Harvard University, Cambridge, Massachusetts, USA;

Objective. To analyze the effects on the spread of HIV among heroin users of various drug law enforcement regimes, drug treatment programs, and policies to change needle-sharing behavior.
Methods. Variables important to the spread of HIV in heroin-using communities are identified, and various policies are analyzed to determine their impact on these variables.
Results. The rate of HIV transmission among heroin users depends on the frequency of needle sharing, the contact-specific risk of needle sharing (risk of infection from any one act of sharing), and seroprevalence in the drug abusing population. Public policy can influence each of these variables. Crackdowns on street-level heroin markets (unlike high-level heroin enforcement) can increase the difficulty of purchasing the drug, thus reducing heroin use without enriching dealers; enforcement against "shooting galleries," where works are routinely shared and rented, can reduce sharing. Illegalizing needles, confiscation of "works," and arrests for needle possession are, by contrast, likely to increase needle-sharing. The distribution of bleach (for sterilizing needles), and needle distribution and exchange programs, can reduce contact-specific risk if coupled with effective education; but needle distribution and exchange programs can have undesirable side effects. The potential for drug treatment to stem HIV infection depends on the rate of seroprevalence in the general user population and among users in treatment.
Conclusions. The decisions of criminal justice and drug treatment officials have an impact on the spread of HIV, and should be taken with AIDS in mind. Police should stop making needle-possession arrests and confiscating "works;" they should target "shooting galleries" for enforcement; and they should crack down on street-level heroin dealing. Education and outreach aimed at heroin users should be stepped up and instituted during the confinement of heroin-using arrestees; simultaneous bleach distribution, and in some cases needle distribution or exchange, may be helpful. Drug treatment should teach needle hygiene in recognition of high rates of recidivism, and treatment programs should give priority to new, uninfected users in areas with high seropositivity and to infected users in areas with low seropositivity.

E.695

PRINCIPLES AND FACTORS AFFECTING HEALTH BEHAVIOR FORMATION AND CHANGE: Report of the Minnesota Commissioner of Health's Task Force on AIDS

Moen, Michael; Burns, D.; Isensee, J.; Shultz, J.; Heckert, K.; The Commissioner's Task Force on AIDS, Minnesota Department of Health (MDH), Minneapolis, MN, USA.

Objective. To provide a framework for Minnesota state and community planners of HIV programs to systematically consider principles and factors affecting health behavior formation and change.
Methods. In January 1988, the Commissioner of Health convened a task force representative of academic institutions, public health, communities of color, government, gay community, and religious organizations, many with recognized expertise in social and behavioral sciences. The task force reviewed epidemiologic data, behavioral literature and identified target behaviors related to transmission of HIV. Demographic, environmental, and individual factors that affect these behaviors were defined relative to implications for HIV prevention and risk reduction.
Result. Specific programmatic recommendations were developed to guide the MDH prevention programs and program planners statewide.
Conclusions. Based on established health behavior principles and data relevant to HIV infection, the report presents strategies that are socially and culturally sensitive and amenable to effective application in a variety of communities, including the gay/bisexual populations, communities of color (American Indian, Asian, Black, Hispanic), and the drug using population. This process can be used to plan future initiatives, assess the appropriateness of existing prevention programs, and is likely to be useful to other states and communities.

E.696

COMMUNITY LEADERSHIP RESPONSE TO THE AIDS EPIDEMIC: THE WORK AND RECOMMENDATIONS OF THE PHILADELPHIA COMMISSION ON AIDS.

Smith, Mark*, Ettinger, F **, Conway, J.*
* University of Pennsylvania, Philadelphia, PA, USA
**Department of Public Health, Philadelphia, PA, USA

Objectives: To investigate the impact of the AIDS epidemic on a large metropolitan community and to further mobilize the community's leadership in the fight against AIDS.
Methods: The Pew Charitable Trusts initiated and funded a 14-member blue-ribbon commission--the Philadelphia Commission on AIDS (PCOA)--which conducted a year-long study of the impact of AIDS in Philadelphia, including sponsorship of 15 separate studies and surveys.
Results: PCOA-sponsored research projected AIDS cases and service needs until 1992, surveyed experiences of persons with AIDS, and documented attitudes of business leaders. The PCOA also delivered a final "Report to the Community" with 109 wide-ranging recommendations to the public and private sectors, based on research findings. The Commission also co-sponsored 6 conferences with existing organizations, and helped to institutionalize AIDS concerns in a number of mainstream organizations.
Conclusions: A broadly-based group of community leaders can be helpful in mobilizing public opinion, drawing attention to the deficiencies of existing programs, defining the costs of AIDS care and the service needs, supporting the work of community-based organizations and stimulating policy debate and planning for health and social services.

E.697

A CLINIC-CENTERED PROPOSAL FOR ENHANCING ACCESS TO NONVALIDATED THERAPIES FOR HIV DISEASE

Freedman, Benjamin; McGill University and the Jewish General Hospital, Montreal, Canada

Enhanced access to nonvalidated treatments for persons with AIDS has been an important thrust of public agitation and policy reform, but carries with it dangers that ineffective and/or dangerous drugs will become clinically established, that the superiority of subsequently developed drugs will never be demonstrated, and that drug companies will reap premature profits from preying upon the credulity and desperation of patients. It is proposed that centres combining clinical expertise, research activity, and appropriate laboratory support, be prospectively permitted to employ investigational new drugs within their own protocols, whether open or controlled, at their discretion (monitored retrospectively by drug agencies), and with the informed consent of their patients. Potential benefits of this proposal include the minimization of prospective regulatory expense and delay; the provision of optimal information to those patients seeking nonvalidated therapies; and, compatibility with the need to complete testing on new agents prior to their being licensed for sale. These aspects of the proposal on its own terms and in comparison with alternatives are detailed, as are uncertainties which need to be resolved prior to implementation.

E.698

MICHIGAN MODEL COMMUNICABLE DISEASE CONTROL POLICY FOR SCHOOLS

Hower, Barbara J., Project Coordinator*; Staff experts from State Departments**; Legal Consultants***. *Michigan Department of Education, Health Education, Lansing, Michigan, USA, **Michigan Departments of Public Health and Civil Rights, Special Education, and State Attorney General's Office, Lansing, Michigan, USA, ***et al.

Objective. To assist local education agencies (LEA) in developing a legal, ethical, and medically sound policy for handling issues relating to HIV infected students or staff members.
Methods. An advisory committee was appointed to provide expert guidance in the development of a model communicable disease control policy which includes an appendix for communicable diseases known not to be spread by casual contact. This model was disseminated to all Michigan LEAs for use by their policy writing committees as a guide for structuring their local policy.
Results. A model policy was developed within the context of a general communicable disease control policy that legally addresses the issues surrounding HIV infected individuals in the school setting. This policy was structured to address those diseases which are known not to be transmitted by casual contact in the school setting and those which can be transmitted by casual contact within the school setting. The policy includes confidentiality issues, handling body fluid spills, student and staff education, legal due process, and legal concerns of special education students.
Conclusion. The model policy has been accepted in districts throughout the state of Michigan. It is currently being trained to other state education agencies at the Centers for Disease Control Training/Demonstration Conferences. The National Association of State Boards of Education is using the model policy in the current development of their HIV policy guide.

E.699 SOCIAL WORK STUDENTS' KNOWLEDGE AND ATTITUDES ABOUT AIDS.

Frankel, Harvy*, Grosser, Shirley*
*University of Manitoba, Winnipeg, Manitoba, Canada.

Objective. To describe social work students' knowledge and attitudes about AIDS, identify relevant contributors.
Methods. Approximately 240 Social Work students completed a survey designed to evaluate their knowledge and attitudes regarding AIDS. A subsample (N = 100)also completed a social distance questionnaire aimed at separating the effects of feelings about homosexuality from feelings about AIDS. This study is the first phase of a broader evaluation of an "inhouse" AIDS education package at the University of Manitoba School of Social Work.
Results. Preliminary results will focus on the level of students' knowledge about AIDS and the nature of their attitudes. The effects of a variety of demographic and contextual variables will be explored.

E.700 FAILURE TO DISCLOSE AIDS DIAGNOSIS, PSYCHOLOGICAL STRESS AND THE UTILIZATION OF SERVICES

Schiller, Nina; Crystal, S.; Dejowski, E.; Hansell, S.; Merzel, C.; Bock, P.

Rutgers University, New Jersey, United States

Objective. To examine the extent, and consequences of the failure by People with AIDS to disclose their AIDS diagnosis to members of their social support network.
Methods. Data from a survey of a population based random sample of living PWAS in New Jersey is analyzed. The sample includes a high number of Intravenous drug users, male homosexuals, racial and ethnic minorities and women. The relationship between this failure to disclose diagnosis and measures of psychological distress, health status and the utilization of informal supports and of formal services is explored.
Results. Failure to disclose diagnosis is found to be widespread. Only a limited number of relatives and friends are told about the diagnosis. The relationship with this attenuated network is strengthened. The failure to disclose diagnosis is shown to vary by risk group, gender, and cultural background and to be related to distress but not to the utilization of formal services.
Conclusion: Failure to disclose diagnosis is a significant variable in the analysis of the psychosocial status and coping behavior of PWAS.

E.701 Adult Day Health Care as a Service Delivery Model

LEAH MASON BECK AND LEN MCNALLY
Village Nursing Home AIDS Day Treatment
New York, NY, U.S.A.

Adult Day Health care has long been available as a service delivery model for older adults. This paper will describe the development and application of this service model for a heterogenous AIDS population at the Village Nursing Home in New York City. Currently serving a client roster of 75, the program provides nutrition, skilled nursing services, psychiatriccar. psychotherapy, medication monitoring and administration, therapeutic group activities and other alternative therapies.
Costs are under a hundred dollars per day per client, and clients demonstrate marked initial improvements in body weight, grooming and mental status. There are some indications as well that the daily nursing|psychiatric triage of each client is shortening hospitalizations. Further study will be required to determine the program's effect on positive outcomes.

E.702 PROJECT OPEN HAND - ATLANTA; DAILY MEALS FOR PERSONS WITH AIDS AND ARC.

RENEE L. PEUGEOT, PROJECT OPEN HAND, Atlanta, Georgia, U.S.A.

OBJECTIVE: To describe a non-profit community based AIDS/ARC support service devoted to providing meals to persons with HIV infection.
METHODS: Project Open Hand - Atlanta, is a non-profit volunteer organization designed to provide nutritionally balanced meals to needy persons with HIV infection. A ten member Board of Directors recruits the aide of volunteers and appeals for funding to Community Organizations, Private Foundations, and Individuals. St. Bartholomew's Episicopal Church provides kitchen, office and storage space for the Project and its volunteers. Daily operations are handled by a volunteer staff consisting of a project director, kitchen coordinator, secretary and approximately 15-20 volunteers each day who assist in preparation and delivery of meals to clients. Each client receives two meals each day, if the client has no way to heat or store the meals, Project Open Hand can loan microwave ovens or refrigerators as needed. Clients are referred by physicians, nurses, social agencies and friends. To qualify for services, clients must express a need for assistance and secure a physician's statement verifying the HIV diagnosis. Assessments are completed on each client to determine special dietary requirements and needs. These needs are addressed when meals are prepared and delivered.

RESULTS:	9/88	10/88	11/88	12/88	1/89
clients served	15	27	38	48	61
meals served	900	1364	2220	2,237	2767
volunteer hours	600	1334	1093	1800	1164

Total $34,000.00 raised for project.

CONCLUSION: Many people with AIDS/ARC face difficulties in matters of daily living. Financial obligations often exceed the amount of disability checks. Many face physical wasting, loss of appetite and apathy about eating. Project Open Hand Provides nutritionally balanced meals to clients at no charge. Clients enjoy the personal contact when the meals are delivered and look forward to the next day.

E.703 A HOSPITAL-BASED VOLUNTEER PROGRAM FOR PATIENTS WITH HIV INFECTION

Bender, Paula, and Sullam, Paul
Department of Medicine, Veterans Administration Medical Center and The University of California, San Francisco, California, USA

Objective: To describe a hospital-based specialized volunteer program devised to meet the emotional and practical needs of HIV+ patients.
Methods: Joint effort of Voluntary and Social Work Services with four components: 1) recruitment of hospital employees, federal employees at large, and gay/lesbian community members, 2) selection based on application and group interview processes, 3) training for 1.5 day training to inform and sensitize volunteers to HIV-related issues, and 4) supervision through individual and group sessions. After "hospital internship," volunteers eligible to work with outpatients.
Results: Volunteers provide necessary emotional/practical support to patients and staff, and aid in bridging communication gaps between patients and staff. Improved continuity of care with volunteers contributing a holistic approach to care.
Conclusions: Volunteers are a necessary component to patient care. Specialized preparation is essential for a successful program. Volunteers aid in decreasing isolation, provide an opportunity to express thoughts and feelings, engender a caring environment, reduce patient stressors, alert staff to daily psychosocial and medical changes, and effectively share the overwhelming burden of care.

E.704 SOCIAL SERVICE WORK RELATED TO AIDS PATIENTS

Mancini,S.; Lotfi,C.J.; Ferreira,A.C.; Motta,P.R.; Colombo,A.L.;Lewi,D.S. from Escola Paulista de Medicina,BRAZIL

OBJETIVE: To give bio-psichosocial counseling to assure a bitter quality of life to the patients.
METHOD: The patients are all with positive HIV results. Nowadays we have 130 patients from jul/1988 to jan/1989. Interviews with the patients and counseling are our means of methodology reaching data that will help clarify their needs.
RESULTS: Characteristics of the patients: 86,2% male,13.8% female; 18.5% married; 72,0% single; 9.2% others; 83,9% are between 24 and 45 years of age; 57.7% homossexual; 13.0% drug addicts; 10.0% bissexual; 19.3% others. We have observed that through the whale work, the 130 patients presented the following patterns: 49.3% of consciousness, 23.9% of behaviour, 3,8% economic, 3.8% of work, 3.1% family, 12.3% two or more patterns and 3,8% clinical occurrences. From these 130 patients: 59.2% maintain their profissional activity; 25.9 are in social security and only 14.6% are inactive.
CONCLUSION: The multidisciplinary help, the education process of conscientization; the process of unmystifying stigmas and diminishing tthe basic social problems surely lead to maintain the AIDS patients productive and socially integrated.

E.705

THE FIRST FEW TIMES GENDER DIFFERENCES IN THE SOCIO-SEXUAL DEVELOPMENT OF WEST-GERMAN ADOLESCENTS

von Salisch, Maria; Oswald, H.; and Lukas, H.
Freie Universität Berlin, Berlin, West Germany

Objective. In order to find out about adolescents' sexual behavior, their values in sexual relationships and their way of dealing with AIDS on a cognitive, emotional and behavioral level, 425 15-to-18-olds filled out a questionnaire on these topics. The sample is about half male and half female and representative for Berlin students of three of the four secondary school types.
Results. (1) Young people of both sexes make their first sexual experiences at about the same age as their peers five or ten years ago;
(2) Berlin adolescents are generally well informed about the ways in which AIDS is transmitted;
(3) Boys and girls differ substantially in the number of sexual partners they report and in their behaviors designed to cope with the risk of an infection. When asked what they considered important in a sexual relationship, girls endorsed "love", "trust & understanding", "tenderness & care" and "sexual fidelity" significantly more often than boys.
Conclusions. Boys and girls embed their first sexual encounters with members of the other sex in the context of different relationship values. Preventive measures have to take these gender differences in socio-sexual development into account.

E.706

SECURING FUNDING FOR PRESERVATION OF LIVES.

Kunst, Robert P.; CURE AIDS NOW, INC., Miami, Florida USA

OBJECTIVE: *To secure funding sources from local government and private sources for implementation/expansion of cost effective direct service and stress management programs.*

METHOD: Submitted role-model cost effective proposals to the *The City of Miami, Dade County and The City of Miami Beach who in the past two years have given us $300,000 in grant monies for our Meals Program, a U.S. first.*

CONCLUSION: *CURE AIDS NOW's "Meals on Wheels" program in the past two years has delivered over 54,000 meals to over 430 clients. Our program delivers not only nourishment, but compassion and companionship to everyone (regardless of age, sex, race etc.) which is the door opener to "TRUST".*

RESULTS: *This nourishment and nurturing effort also addresses the malnutrition problem of AIDS. Through trust and compassion we have helped reduce the stress which accelerates the disease and reduce the hospital cost of $1,000 per patient, per day to the taxpayers.*

E.707

SURVEY OF EMERGENCY HOUSING FACILITIES IN NEW JERSEY FOR PEOPLE WITH AIDS (PWAs) AND HIV RELATED CONDITIONS

Hummel, Robert; Wells, D.; Rodriguez, G.; Fernandez-Rubio, H.; Rotkiewicz, L.; Jackson, J.
New Jersey State Department of Health, Trenton, NJ, USA

Objective. Adequate care for those with HIV related conditions often begins with emergency, off-street shelters. In order to estimate the scope of support services throughout New Jersey a survey was mailed to the 72 shelters.
Method. The four-page questionnaire contained items concerning demographics services/facilities rules/regulations and AIDS.
Results. There was a 76% response rate (55/72; 23-1st mailing, 19-2nd mailing, 13-telephone follow-up). More than half of the shelters serve women, men and families; roughly one-fourth serve alcoholics/IVDUs; only 5 sites serve runaway youth. Frequently listed criteria for admission included: free of communicable disease (73%), drug (excluding methadone)/alcohol free (71%), and willing and able to work (38%). Sixteen respondents said their shelter's policy was to admit PWAs. Reasons for not admitting PWAs were: facility not appropriate, insufficient staff or staff training, and negative client, staff or community reaction. Nine respondents said they would be willing to have their shelter listed as a resource for PWAs. While almost all had written rules/regulations, few had formal infection control guidelines (13%).
Conclusions. While only nine facilities are currently willing to be listed as a resource for PWAs, with provision of AIDS education, infection control guidelines and additional support, other shelters may also be willing to supply this vital emergency care in the future.

Prévention et santé publique
Prevention and Public Health

E.708

PRIOR HIV ANTIBODY TESTING EXPERIENCE (AbTE): ASSOCIATION WITH HIV Ab SHARING AND HIGH-RISK BEHAVIOR IN A SAMPLE OF GAY/BISEXUAL MEN.

Bartholow, Brad[*]; Douglas, J.[*]; Peppler, M.[*]; Bolan, G.[**]; Moss, P.[***]; Doll, L.[****].
[*] Denver Disease Control Service, Denver CO; [**]San Francisco Public Health Dept, [***]Howard Brown Clinic, Chicago IL; [****]Centers for Disease Control, Atlanta, GA., USA.

Objective: To evaluate prior HIV AbTE and its association with Ab sharing and persistant high-risk sexual behavior in a sample of homosexual/bisexual men.
Methods: 517 men attending STD clinics in Chicago, Denver, and San Francisco, who engaged in unprotected anal or oral sex in the previous 4 months were interviewed from April-December, 1988. Prior HIV AbTE was as follows: 1) 18% tested HIV+ (T+), 2) 34% tested HIV- (T-), 3) 9% were tested but didn't learn results (TNR), and 4) 38% were never tested (NT). Comparisons were made using X^2 and Kruskal-Wallis 1-way ANOVA procedure.
Results: HIV AbTE did not vary by age, ethnicity, education, or AIDS knowledge. T- men shared their Ab status with a greater number of both steady (77% vs. 46%, p<.0001) and nonsteady (15% vs. 7%, p<.0001) partners than did T+ men. Differences in knowledge of sex partner's HIV Ab status varied as follows:

Percent Sex Partners of Known HIV Ab Status by Subject's Prior HIV AbTE

	T+	T-	TNR	NT	p
Primary Partners	67	66	33	25	.0001, T+/T- vs. TNR/NT
Steady Partners	39	43	22	25	.0001, T+/T- vs. TNR/NT
Nonsteady Partners	4	11	15	5	.0001, T+/T-/TNR vs NT

In the past 4 months T+ men were significantly more likely (p<.007) to have: 1) a greater number of nonsteady sex partners, 2) a greater % of unsafe receptive anal contacts, 3) been the receptive anal partner, 4) paid for sex and, 5) injected IV drugs.
Conclusions: Among gay men persisting in high-risk sexual activity, HIV AbTE correlates with sharing/knowledge of HIV Ab status as well as certain risk behaviors, but more research is needed to determine if observed findings are due to AbTE or intrinsic subject differences.

E.709

A COMPARISON OF SEROLOGIC CHARACTERISTICS IN HIV ANTIBODY POSITIVE VS. HIV ANTIBODY NEGATIVE VOLUNTEER BLOOD DONORS

Gilcher Ronald O, Chandler LK, Belcher LO, and Smith JW.
Sylvan N. Goldman Center, Oklahoma Blood Institute, Oklahoma City, OK, USA

Objective. A retrospective analysis of volunteer blood donors from a regional blood center in the South Central United States was conducted to evaluate serologic characteristics and determine whether other markers occur with increased frequency in anti-HIV positive, WB positive donors.
Methods. From March 1985 through December 1988, 205,413 donors had 505,528 donations. All donations were routinely tested for the following serological markers: anti-HIV, HBsAg, anti-HBc, RPR, and ALT (SGPT).
Results. Seventy-six donors of the 205,413 were found to be positive for anti-HIV (EIA), WB confirmed, resulting in a seroprevalence of 0.037%. The table below compares the percentage of positive test results within the two groups.

Test	anti-HIV Pos, WB Pos (n=76)	anti-HIV Neg (n=205,337)
HBsAg	5.3%	0.19%
Anti-HBc	42.1%	2.7 %
RPR	2.6%	0.17%
↑ALT	13.2%	0.2%

Conclusion. Our results confirm an increased frequency of seropositivity for HBsAg, anti-HBc, RPR, and elevated ALT in anti-HIV positive, WB positive donors. The significance of anti-HBc and elevated ALT as surrogate markers will be discussed.

E.710

COMPARATIVE EVALUATION OF PASSIVE PARTICLE AGGLUTINATION TEST FOR ANTIBODY TO HIV-1 IN A BLOOD DONOR POPULATION

Beisell, J.; Patterson, H.; and Peetoom, Frans
American Red Cross, Pacific Northwest Regional Blood Services, Portland, Oregon, USA

Objective. The primary objective of these studies was to compare the performance (sensitivity and specificity) of a new Particle Agglutination Test, SERODIA HIV*, to that obtained with the well established ABBOTT ELISA assay.
Methods. (1) A total of 2492 routine blood donor samples were tested. (2) In addition, 51 samples from individuals diagnosed with AIDS/ARC, or with possible exposure to HIV, were used in the comparative evaluation which, also, included Western Blot. (3) Finally, comparative sensitivity was studied in a sample dilution study (a), whereas SERODIA was separately evaluated for reproducibility as well (b).
Results. Study (1) showed a percentage agreement between the two assays of 99.6% on initial testing. Nine samples were ABBOTT positive and SERODIA negative. Upon retesting, all samples were negative by both assays, for an agreement of 100%. Study (2) showed a percentage agreement between the two screening assays of 86.3% on initial testing. After repeat testing, the agreement was 88.2%. The percent agreement for the SERODIA assay on Western Blot positives was 100%. Study (3a) showed SERODIA to be more sensitive than ABBOTT when comparing end point titers of four randomly selected HIV positive samples. Study (3b) showed that two different lots of SERODIA reagents, used on two different days, and on each occasion tested 10 times against three different patient samples, produced remarkable consistency in titer end points.
Conclusion. In our hands, SERODIA HIV methodology performed extremely well, and results appeared to outperform those obtained with ABBOTT reagents available for the study, in some significant respects.

*Fujirebio, Inc.

E.711

A NOVEL METHOD FOR BLINDING ROUTINE BLOOD SAMPLES AND DATA COLLECTION PRIOR TO HUMAN IMMUNODEFICIENCY VIRUS (HIV) ANTIBODY TESTING FOR UNLINKED SEROPREVALENCE SURVEYS

Timperi, R.; Brody, O.; Kappes, Rosemarie; Bracci, P.; Berardi, V.; Moye, J.; et al. MA Dept Public Health State Laboratory Institute (SLI), Boston, MA,USA

Objective: To design a system to collect demographic and other data without personal identifiers on routine blood samples for subsequent HIV antibody testing to determine seroprevalence in certain population groups.
Methods: Routine blood samples are submitted to SLI for serologic testing for syphilis (STS). Data from test requisitions including date, name, age, sex, race, residence, indication for testing, information on risk behaviors, and reason for clinic visit are entered into a laboratory computer database. After STS, unused sera are aliquoted into tubes marked only with a sample number in alcohol soluble ink. The sample number permits access to all data entered from the requisition into the laboratory computer database. A computer program extracts only nonidentifying demographic, risk, and reason for visit variables from the database with STS result. This information is encoded in a bar code label which is applied to the tube. The sample number is then removed with alcohol, blinding the specimen. Blinded samples are placed in tube racks in random order, frozen, and batched for HIV antibody testing. When ready for testing, data from the bar code label are read electronically into a separate computer file with a new sample number, to which the HIV antibody result is assigned.
Results and Conclusion: Information on HIV seroprevalence by age, race, sex, area of residence, risk, reason for visit, and STS result is obtained from routine blood samples with maximum preservation of patient confidentiality.

E.712

THE EPIDEMIOLOGICAL SIGNIFICANCE OF OFF-SITE HIV COUNSELING AND ANTIBODY TESTING AMONG STUDENTS ATTENDING AN URBAN STATE UNIVERSITY

Ritchey, Michael, Tripp D., Cincinnati Health Department, Cincinnati, Ohio, United States of America

Objective. To describe HIV infection risk behavior patterns and HIV antibody sero-prevalence rate among students attending a state university having a large urban campus in a city with a moderate HIV infection prevalence rate.
Methods. In cooperation with student campus organizations, free and anonymous HIV antibody counseling and testing was advertised and subsequently made available during a three day period at the University of Cincinnati Student Center. Counseling and testing procedures were identical to those utilized during the past three years at the HIV Counseling & Testing Site, Cincinnati Health Department. HIV risk assessment data was recorded on a standard form. Data was then optically scanned and analyzed using The Medical Information Management System (MIMS), an automated data storage and retrieval program.
Results. A program of off-site HIV antibody counseling and testing can be a successful epidemiological tool in assessing HIV prevalence rates within a well defined population. Although the unprotected sexual activity level is substantial among students on an urban state university campus, HIV prevalence rates reflect moderate nature of this infection prevalence within other community groups.

E.713

ANONYMOUS OR CONFIDENTIAL HIV TESTING AT STD CLINICS

Beidas, Sary*; LoConte J.**; Byrnes D.**. *Saint Michael's Medical Center, **East Orange Health Department, Newark,N.J.

Objective. Should anonymous or confidential testing be the preferred method of testing for HIV infection in STD clinics.
Methods. Over a 7 month period, 340 patients were seen at the STD clinic of an Inner City neighborhood. Counselled patients were given the choice of confidential or anonymous HIV testing.
Results. 248 patients were counselled. Only 140 patients accepted HIV-Antibody testing. Anonymous testing was chosen by 50% of the patients. In 13 (9%) patients HIV-Antibody was positive. Of the 140 patients tested only 28 (20%) called for results of their test. Due to anonymous testing 7 HIV-Antibody positive patients could not be traced.
Conclusion. The above data demonstrate that in an STD setting, confidential HIV testing is more appropriate than anonymous testing, since field workers would be able to follow up on positive cases and hence assure the necessary medical follow up care for patients.

E.714

SHARING THE NEWS: TRAINING BEGINNING COUNSELORS TO DISCLOSE HIV ANTIBODY TEST RESULTS

Quackenbush, Marcia*; Pies, C.**; Brookman, J.*; Deitch, D.*; Ramirez, A.***; Jasperson, J.***

*University of California AIDS Health Project, San Francisco; ** Education Program Associates, Campbell CA; ***California Department of Health Services, Office of AIDS

Objective. To present a training model designed to train beginning HIV antibody counselors how to provide pre- and post-test counseling.

Methods. The UCSF AIDS Health Project, through the alternative test site program in San Francisco, has provided over 40,000 antibody test results. The Project has provided training for approximately 1,500 persons on how to provide antibody test counseling. A three-day *HIV Antibody Counselor Training* course has been developed for this purpose. This presentation will discuss the philosophy of training, share specific training techniques used, outline the strengths of the program and share some of the difficulties encountered.

Results. 15 three-day trainings will be held throughout the state by June, 1989. Preliminary evaluation of the program's success will be offered. The complete training manual will be available for review.

Conclusions. This carefully planned and proven training program for new HIV antibody test counselors will aid in the provision of pre- and post-test counseling services in HIV antibody test settings.

Supported in part by a grant from the California State Office of AIDS, contract # 88-94679.

E.715

WILLINGNESS TO OBTAIN HIV ANTIBODY TESTING IF RESULTS MUST BE REPORTED RATHER THAN CONDUCTED ANONYMOUSLY

Kegeles, Susan; Catania, J.; Coates, T.; Lo, B. University of California–San Francisco, California, USA.

Objective. To examine, among people who are seeking the HIV antibody test, whether changing the conditions under which testing would be conducted would influence the willingness to obtain testing. This was part of a larger study on the consequences of HIV antibody testing.

Methods. All adults seeking testing at an alternative test site (where testing is offered free of charge and anonymously) were asked to participate in the larger study (N = 997) by completing self-administered surveys (participation rate = 96%). A random subset of the larger study participants (N = 158) were asked about the conditions under which they would be willing to be tested.

Results. Thirty-nine percent reported that they would avoid testing if it were conducted confidentially rather than anonymously. Sixty percent said that they would avoid testing if the names of seropositives had to be reported to public health officials, but kept confidential or if seropositives had to be reported and contact-tracing would be conducted. There were no significant differences in the proportions of gay/bisexual men versus heterosexual men and women who would consent to testing under the various conditions (76% of those seeking antibody testing were heterosexual).

Conclusions. Previous research has shown positive effects on risk behavior when people voluntarily seek anonymous antibody testing; these findings indicate that many people who otherwise would have sought testing will avoid it if such testing is no longer conducted anonymously.

E.716

RISK FACTORS AND HIV SEROPREVALENCE IN FEMALE CLIENTS OF SELECTED HEALTH DEPARTMENT CLINICS, HOUSTON, TEXAS

Crane Martin*; Tortolero S*; Garcia G*; Smith D*; Hardikar S**
*University of Texas Health Science Ctr, Houston, Texas, U.S.A.
**Department of Health and Human Services, City of Houston, Texas, U.S.A.

Objective. To determine prevalence of HIV infection and risk factors for its acquisition in women attending selected City Health Department Clinics in Houston, Texas.
Methods. Between 2/29 and 9/30/88, 4,977 women attending Family Planning, Maternity and Sexually Transmitted Disease (STD) clinics completed an anonymous, self-administered risk assessment questionnaire. Of these, 1083 referred themselves for counseling and completed a risk factor interview.
Results. Nine (1.2%) of the 722 women who were tested for HIV were confirmed as seropositive by Western Blot and 12 (1.7%) had equivocal test results. Approximately 20% of the women completing the self-administered risk assessment form reported at least one factor that would have made them eligible for HIV testing including self or partner using IV drugs (5%), STD within the previous 5 years (15%) or bisexual or HIV-infected partner (3%). Only 36% of these women referred themselves for counseling and testing. Of the women who were tested, approximately 10% were considered to be at increased risk of HIV infection by virtue of IV drug use or an ongoing relationship with a high risk partner.
Conclusion. Although HIV seroprevalence is relatively low in this self-selected population, conditions exist for its continued spread. A significant number of women attending these clinics maintain their increased risk.

E.717

FAILURE TO RETURN FOR HIV TEST RESULTS: A SECOND LOOK AT DETERMINANTS

Deborah Rugg, D. Higgins, D. Schnell
Centers for Disease Control, Atlanta, Georgia USA

Objective: To assess factors affecting a 50% failure to return rate in an anonymous HIV Counseling and Testing Site(CTS).

Methods: A questionnaire designed to measure the psychosocial, behavioral, and demographic factors found to be predictive of failure to return in past studies, as well as the immediate impact of pre-test counseling, was self-administered by 503 CTS clients in Dekalb County, Georgia.

Results: Respondents were male (57%) and female (43%), white (69.4%) and black (29%), generally single(53.3%) heterosexuals(86.1%). Bivariate and multivariate regression analyses showed race to be the single most independently predictive factor in determining failure to return (Chi square=48.4,p<.001). Additionally, race was also a factor in study participation, although those who didnot participate in the study had the same return rates as those who did. Significant differences between counselors in their clients return rates was also observed (chi square = 34.9, p < .001). Past reasons for failure to return included fear of test results (50%) and a low priority on learning results (50%). Serostatus and risk group membership were not significant predictors of failure to return.

Conclusion: This study suggests failure to return rates are affected by race and counselor variables. Exactly how these variables operate to affect return rates warrants further study.

E.718

MULTI-LAB STUDY RESULTS OF A NEW RECOMBINANT ELISA IMMUNOASSAY FOR ANTIBODIES TO HIV COMPARED AGAINST DUPONT WESTERN BLOT.

B. Madan, M. VanWinkle, M. Scott (Beckman Instruments, Inc., 200 S. Kraemer Blvd, Brea, CA 92621); Dr. M. Busch (Irwin Memorial Blood Bank, San Francisco, CA); Dr. M. Ascher (State of CA, Dept. of Health Services, Berkeley, CA); Dr. R. Thorstensson (Swedish National Bacteriological Lab, Stockholm, Sweden)

The etiologic agent implicated as the probable cause of Acquired Immunodeficiency Syndrome (AIDS) is the Human Immunodefiency Virus (HIV).

The Beckman ASQ™ HIV Reagent Kit is a semi-quantitative assay for the detection & identification of antibodies in human serum or plasma to proteins representing CORE (p24 and Kp 55), ENV (Kp 41, Kp 120N & Kp 120cc) & POL (Kp 66/31). These antigens are purified recombinant peptides produced by genetic engineering techniques in E. Coli. Individual peptides are presented in a microtiter plate format.

After incubation of diluted sample (1:100) in the microtiter plate, the plate is washed, developed with alkaline phosphatase conjugate/substrate & read at 410/490 nm. Total assay time is less than 4 hours.

The absorbence cutoffs for each peptide was established with 1030 samples. Using the established criteria of positivity for ASQ, 1840 samples were compared against DuPont Western Blot.

		ASQ		
		NEG	INDETER	POS
DWB	NEG	1082	16	0
	INDETER	117	118	126
	POS	0	5	376

Beckman recommends that each evaluator establish their own cutoff & criteria of positivity for this research use only product but found excellent results with the stated criteria in correlation to DuPont Western Blot.

E.719

RAPID, INSTRUMENT-FREE ASSAYS CAN BE USED IN TANDEM FOR SCREENING AND CONFIRMATION OF HIV INFECTION.

F. Spielberg[1]; K. Auditore-Hargreaves[1]; W.L. Heyward[2]; R.W. Ryder[2,3]; T.C. Quinn[4]; Milton R. Tam[1]; *et al.* [1] The DiaTech Program of the Program for Appropriate Technology in Health, Seattle, WA, USA; [2]CDC, Atlanta, GA, USA; [3]Projet SIDA, Kinshasa, Zaire; and [4]NIAID, Bethesda, MD, USA.

Objective. Although alternative methods to blood screening by conventional ELISA exist, to date Western blot (WB) remains the accepted confirmation method. This study was to evaluate performance and cost-effectiveness of rapid, instrument-free assays used in tandem for screening and confirmation.

Methods. 3,078 serum samples (5.5% HIV-1 seroprevalence) were collected and tested on each of five different rapid assays, as well as conventional ELISA and WB in Kinshasa, Zaire. The results were analyzed retrospectively to determine the accuracy of a test method which included neither ELISA nor WB.

Results. A testing hierarchy comprised of duplicate screening assays, followed by confirmation in duplicate of all repeatably reactive specimens, provided perfect accuracy when HIVCHEK (Du Pont) was employed as the screening assay and Serodia-HIV (Fujirebio) as the confirmatory assay. Compared to the standard method of ELISA screening and confirmation by WB, the rapid method resulted in a cost savings of approx. $3.00 per positive specimen identified.

Conclusions. The ability to use one rapid assay to confirm the results of another can be expected to facilitate blood screening in developing country transfusion centers, where highly technique-dependent methods such as WB are not appropriate. While a modest cost savings can be realized without compromising accuracy, the major advantages are in the savings of time and labor, and eliminating dependence on capital equipment. However, despite these considerable advantages, the cost per HIV-positive unit identified is still unrealistically high for the majority of developing countries.

E.720

TB SKIN TESTING: A PROTOCOL FOR IMPROVING HEALTH AND PSYCHOSOCIAL INTERVENTION WITH HIV SEROPOSITIVE INDIVIDUALS

Anderson, P; Freeman, A; Haley, Charles E.
Dallas County Health Dept., Dallas, TX, USA

Objective. To improve TB screening of HIV antibody positive clients, improve partner notification efforts, improve assessment of client's emotional status, and improve client comprehension and retention of HIV positive counseling messages. Method. Offer TB skin test (PPD) at post test counseling session to all individuals testing HIV positive. For those who accept, another counseling session will be offered in conjunction with the appointment to read the skin test. The counseling session could include any of the following: 1.) Reassessment of client's emotional status including suicidal tendencies, 2.) Assessment of clients knowledge and retention of post-test counseling messages and their reinforcement. 3.) Partner notification counseling to enhance, through roleplay, client's willingness and ability to tell sex and/or needle-sharing partners they may have been exposed to HIV. Health Dept.'s assistance will be offered on a voluntary and anonymous basis when counselor assesses the need for it or the client requests the service. Results. Program will begin February 1, 1989. Results of client acceptance of this program will be presented. Conclusion. Upon learning their HIV seropositive status, clients may be anxious and in shock and thus retain a very small percentage of information from the post test counseling session. Discussion of partner notification can also be inappropriate at that time. The TB test provides a health screening as well as a reason for a return visit for additional counseling and assistance with partner notification.

E.721

POLICY, LEGISLATION AND RESPONSE; MANDATORY HIV TESTING OF U.S. PRISONERS

Kantor, Elizabeth, Medical Director, San Francisco County Jails; University of California, San Francisco, USA

Objective. To consider policies and legislation regarding mandatory HIV antibody testing of US prisoners, and to compare the different responses of health care and prisoner advocacy personnel to essentially similar mandates.

Methods. A review of local policies, popular elections and legislative actions mandating HIV antibody testing of prisoners will be presented.

Results. Health care personnel and prisoner advocates have responded to these mandates with varying degrees of enthusiasm or opposition. Mandatory testing necessarily excludes informed consent, confidentiality of results, and often is not tied to counselling and education. In some jurisdictions, health care personnel are required to provide institutional staff with lists of HIV + or "possibly infected" individuals.

Conclusion. Mandatory HIV testing presents challenges to professional norms, standards of care, and to individual rights.

E.722

STD SCREENING AT ALTERNATE HIV TEST SITES?

Thompson Carolyn+; Cowan FM*, Bisset CM*, Robertson DHH+, Brettle RP*. +Dept. Genitourinary Medicine(GUM), Royal Infirmary, *Communicable Diseases Unit, City Hospital, Edinburgh, UK.

Objective. In 1985 the City Counselling & Screening clinic(CSC) was set up as an alternate HIV test site & has now seen 1718 clients (25% were injection drug users [IDU]). A prospective study was set up to assess the need to screen for sexually transmitted diseases(STD) in clients worried about HIV.

Method. New clients were offered STD screening, their risk factors for HIV & for concurrent STD(nil/low/high) were assessed. Comparison was made with those attending GUM for an HIV test.

Results. Preliminary results on 605 GUM & 110 CSC clients.

	GUM(55 had HIVtest 0+,55-)		CSC (80 had HIV test 5+,75-)			
STD risk	HIV tested	STD +	No seen	STD test	STD Defaults	STD +
Nil	2	0	20	1	0	0
Low	27	9	36	6	4	0
High	26	9	22	6	1	2
Not Known	-	-	2	0	1	0
Total	55	18	80	13	6	2

Conclusion. None of the CSC IDU had STD tests which may imply they do not regard HIV as an STD (one of 2 STD + was a partner of IDU!) Assessed risk of STD was higher in GUM patients(26/55) than CSC (22/80); the STD prevalence in GUM(33%) was twice that of CSC(15%) in those HIV and STD tested. 19/80 (24%) CSC clients wished STD tests other than HIV. Of these 6(32%) defaulted after a negative HIV result. It seems clients' choice of clinic depends on their perceived STD risk. People are resistent to STD testing at CSC, which has important implications for health education regarding HIV spread.

E.723

FACTORS ASSOCIATED WITH SEEKING THE HIV SCREENING TEST

Vesta Kimble, Health Policy Institute*; L. Mofenson#; R. Hingson* *Boston Univ. #Mass. Dept. of Public Health, U.S.A.

OBJECTIVE. To determine if those at risk for HIV infection are more likely to obtain a screening test.

METHODS. A statewide anonymous random digit dial telephone survey of 1,323 Massachusetts residents was conducted in October 1987. Information about demographics, attitudes and concerns about AIDS, and risk factors was obtained and examined in relation to whether respondents had been tested or would be willing to be tested for the HIV antibody (AB).

RESULTS. Of 1,323 respondents, 111 (8%) had been tested; all but two had received negative test results. Persons with at least one risk factor were more likely to have received the test than those without risk factors (12.5% v. 7%), ($p<.05$).

RISK FACTOR	NUMBER	% TESTED	% WILLING TO BE TESTED
Gay/bi males + partners	59	14%	61%
IV drug users + partners	79	11%	71% ($p<.05$)
Blood recipients + partners	75	23% ($p<.05$)	47%
Respondents with other sex risks + partners	577	11% ($p<.05$)	60% ($p<.05$)

Persons who had not been tested and had at least one risk factor were more willing than those without risk factors to be tested if the test were free and anonymous. (58% v. 40%), ($p<.05$).

CONCLUSION. Although members of risk groups were more likely to have received the screening test, the proportion of respondents with risk factors who had been tested was relatively low. Of those not yet tested, a majority would be willing to be tested. The use of free and anonymous tests may increase the likelihood that individuals at risk will choose to be tested.

E.724

THE EFFECT OF HIV ANTIBODY TESTING UPON SEXUAL BEHAVIOR, CONCERN ABOUT AIDS AND AIDS RISK COMMUNICATION.

Neil S. Wenger, MF Shapiro, LS Linn. UCLA Department of Medicine, Los Angeles, California. U.S.A.

Objective. We evaluated the effect of a negative HIV antibody test upon sexual behavior, concern and knowledge about AIDS, and communication with sexual partners (SPs) about AIDS risk.

Methods. 256 heterosexuals attending an urban sexually transmitted disease (STD) clinic entered a randomized trial of HIV testing. All subjects received AIDS education and pre-test counselling, completed a questionnaire, and had blood drawn, then 124 received a "TEST" and post-test counselling; 98% tested negative for HIV. The 132 "NO TEST" subjects were informed of alternative test sites. A follow-up survey was completed ~8 weeks later.

Results. Participants had a mean age of 27 years; 66% were male, 84% were black. TEST and NO TEST groups did not differ in baseline number of recent unprotected SPs, in number of inquiries to SPs about AIDS risk or in AIDS knowledge. Follow-up of 70% of subjects revealed a decrease in mean monthly number of unprotected SPs (1.7 to 1.2, $p=0.0001$), but no difference between TEST and NO TEST groups ($p=0.38$). TEST subjects, however, reported that they were more worried about getting AIDS ($p<0.03$) and asked partners more questions about AIDS risk ($p<0.001$). They were more likely to increase questioning of partners about HIV tests ($p=0.004$) and intravenous drug use ($p=0.001$). AIDS knowledge did not differ at follow-up.

Conclusion. In STD clinic subjects who received an educational intervention, HIV testing was associated with increased concern about getting AIDS and more questioning of SPs about AIDS risk, but did not affect knowledge about AIDS or sexual behavior.

E.725

Recruitment of Research Subjects at Risk for AIDS

Authors: Pamela Mailer, R.N.; Barbara Libermen, B.A.; Patricia Walter, B.A.; Lawrence Jacobsberg, M.D., Ph.D.; Samuel Perry, M.D.; Cornell University Medical College, New York, N.Y., U.S.A.

Objective: To test methods for recruiting physically asymptomatic subjects at risk for AIDS into longitudinal psychobehavioral studies. Background: Despite the crucial public health need, limited prospective clinical data are available regarding the psychological and behavioral effects of being at risk for acquiring or transmitting HIV. Because many potential subjects fear breach of confidentiality and see little personal benefit in burdensome studies, findings to date have generally been from self-report measures of select samples of gay/bisexual males. Methods: To reduce concerns about confidentiality, our study was conducted in a private residential setting and with an agreement that no information would be given to any third party; further, careful arrangements were made to preclude subjects seeing one another, and contact for follow-ups was arranged in accord with subjects' specifications. To offset the burden of extensive clinical assessments, we provided free periodic HIV testing and individualized counseling by a psychiatric nurse. Results: Over 18 months, in depth prospective clinical psychobehavioral assessments were obtained on 260 physically asymptomatic subjects who were sociodemographically heterogeneous and represented major risk groups: 145 gay/bisexual males, 34 IVDU, and 81 heterosexuals with suspected or known infected partners. Seropositivity rate was 17%, and attrition at 6 months was 29%. Conclusion: If confidentiality is absolutely protected and supportive care provided, psychobehavioral studies of at-risk populations are feasible; however, in designing and budgeting future studies, researchers should consider the additional demands and cost of meeting special requirements posed by the AIDS epidemic.

E.726

PERCEPTION OF RISK FOR HIV INFECTION AND THE DESIRE FOR HIV TESTING AMONG IV AND NON-IV DRUG USERS

Weber, John*; Abdul-Quader, A.**; Freid, C.*; Rockwell, R.**; Yancovitz, S.*.
*Beth Israel Medical Center, N.Y., N.Y., U.S.A., ** Narcotic and Drug Research Inc., N.Y., N.Y., U.S.A.

Objective. Since HIV testing is advocated for high risk behavior groups, we ascertained the perception of risk for HIV infection and the desire for HIV testing among Intravenous [IVDU] and Non-intravenous [Non-IVDU] drug users entering a detoxification facility in NYC.

Methods. A brief survey was administered to 100 substance users applying for detoxification from drugs or alcohol. Information was collected concerning their understanding of HIV testing, their perception of their risk for HIV infection and whether they wanted to be tested for HIV.

Results. N=100, 70 male 30 female, Mean age = 35, 48 Black, 34 Hispanic, 14 White.
63= IVDU's of heroin or cocaine, 37=Non-IVDU (use cocaine, alcohol, or methadone).

	IVDU	Non-IVDU	
1. Aware of the existence of the HIV Test	60%	39%	($p<.05$)
2. Cognizant of spectrum of HIV infection from asymptomatic to AIDS	53%	37%	ns
3. Estimate that their own risk of HIV infection was ≤ 10%	81%	81%	ns
4. Previously HIV tested	44%	19%	($p<.05$)
5. Wanted to HIV testing during this hospitalization	77%	67%	ns

Verification of self expected HIV negative status was the reason given by the majority of those who wanted to be tested.

Conclusion. IVDU's were more likely to know about HIV testing and were more likely to have been tested. However, IVDU's tend to minimize their risk for HIV infection.

E.727

REASONS FOR NOT DISCLOSING HIV-ANTIBODY TEST RESULTS TO OTHERS - DATA FROM A COHORT OF SEROPOSITIVE GAY MEN

R Stempel; J Moulton; P Bacchetti; AR Moss. School of Medicine, University of California, San Francisco; San Francisco, CA, USA.

Objective. To determine the reasons for not disclosing positive HIV-antibody test results to others, in a cohort of gay men.

Methods: 77 seropositive gay men reported reasons why they were concerned about disclosing HIV-ab test results to others at 2 weeks, 3, 6 & 12 months following notification, using a questionnaire developed by Mendel.

Results: Percent Stating Reason as Barrier to Disclosure:

	2 WEEKS POST-NOTIFICATION	1 YEAR POST-NOTIFICATION
Fear of Practical Losses:		
Job	73%	43%
Insurance	63%	07%
Housing	50%	38%
Fear of Relationship Losses:		
Lover	20%	16%
Sex Partners	30%	26%
Family	37%	41%
Friends	22%	05%
Fear Image as 'AIDS Carrier'	70%	05%

Conclusion: Potential loss of (health) insurance, housing and jobs are primary reasons for not wanting to disclose HIV-antibody test results to others. Fears of disturbing close relationships are of less concern. Worries of being perceived as an 'AIDS carrier' diminished over the year.

E.728

HIV TESTING AT AN ALTERNATE TEST SITE IN NEW YORK CITY.

Binder, Wayde; Hirschorn, E.; Harawitz, S.; and Mathur-Wagh, U. Beth Israel Medical Center, New York, NY. U.S.A.

Objective: To describe the population characteristics of persons presenting for HIV testing at an alternate test site in New York City.

Methods: The Infectious Disease Clinic at Beth Israel Medical Center was designated as an alternate confidential HIV test site in January 1988. Pretest counseling was provided to all persons seeking testing. On all persons tested, clinical and demographic information was obtained. HIV serology was performed using the ELISA and was confirmed by the Western Blot assay. Post-test counseling was offered to all after receipt of Lab results.

Results: Of the 531 persons tested during 1988, 244 were males, 221 were females and 66 were children of high risk mothers. Overall, 105(43%) males, 51(23%) females and 26(39%) children tested were seropositive. Analysis of data according to risk group for adult males and females is tabulated below:

positive/#tested (% positive)

Risk Group:	Gay and Bisexual	IVDU	Transfusion Recipient	Health Care Worker	Heterosexual (Par. Unknown)	Heterosexual (Par. High Risk)
MALES n=244	31/71(44%)	68/89(76%)	0/7(0%)	0/2(0%)	5/60 (8%)	1/15 (7%)
FEMALES n=221	-	31/40(77%)	2/15(13%)	0/11(0%)	4/94(4%)	14/61(23%)

Conclusions: 1) A heterogeneous population sought testing at our alternate test site during 1988. 2) The majority (66%) of men who presented for testing belonged in conventional risk groups (gay,IVDU). 3) In contrast, the majority (70%) of women came for testing because of concerns over their heterosexual relationships.

E.729

DISCLOSURE OF HIV-ANTIBODY TEST RESULTS & REACTIONS OF SEXUAL PARTNERS, FRIENDS, FAMILY & HEALTH PROFESSIONALS

[illegible] J Moulton; P Bacchetti; AR Moss. School of Medicine, University of California, San Francisco; San Francisco, CA, USA.

Objective: To investigate to whom HIV-ab test results are disclosed.
Methods: 107 gay men reported: (1) Persons told results of HIV-ab test and (2) their reactions - at 2 weeks, 3, 6 & 12 months following notification.
Results: Percentages to Whom HIV-ab Test Results Were Disclosed
(Percentage of Those Told Expressing Unfavorable Reactions):

	2 WEEKS POST-NOTIFICATION		1 YEAR POST-NOTIFICATION	
Person	Positives	Negatives	Positives	Negatives
Lover	26% (13)%	43% (20)%	44% (17)%	82% (00)%
SexPartners	10% (00)%	10% (00)%	21% (21)%	22% (00)%
BestFriend	85% (04)%	79% (00)%	72% (06)%	100% (00)%
Mother	15% (17)%	33% (00)%	26% (17)%	37% (00)%
Father	07% (20)%	13% (00)%	15% (14)%	15% (00)%
Physician	23% (13)%	10% (00)%	90% (00)%	45% (00)%
Dentist	22% (30)%	05% (00)%	30% (26)%	15% (00)%

Conclusion: About Half of lovers and nearly a third of new sexual partners were told test results - more quickly by negatives than positives. Friends were almost always told and reacted well. Mothers were more than twice as likely to be told as fathers. Most physicians had been told by one year after notification -- but less than a third of dentists. Negatives had favorable reactions from all; positives experienced their most unfavorable reactions from dentists and sexual partners.

E.730

QUALITY ASSURANCE IN ANTI-HIV TESTING

Hanson, Margaret and Polesky, HF. Memorial Blood Center of Minneapolis, Minnesota, USA.

Objective. To document the high quality of anti-HIV testing performed by laboratories participating in external proficiency testing programs.
Methods. The College of American Pathologists and the American Association of Blood Banks jointly sponsor a proficiency testing program for laboratories testing for antibody to human immunodeficiency virus (anti-HIV). Panels of 5 samples each are mailed quarterly to approximately 1000 subscribers. Participants are provided with a report summarizing results by test method and reagent manufacturer.
Results. Over the past 3 years greater than 98% of laboratories reporting ELISA screening methods have correctly identified anti-HIV reactive samples. Reports from laboratories using Western blot confirmation methods also show greater than 95% agreement on reactive samples. Non-reactive samples were correctly identified by greater than 99% of laboratories reporting confirmatory testing while those using only ELISA screening tests were more likely to report false positive results. Some variability in sensitivity and/or specificity of both ELISA and Western blot test reagents can be documented.
Conclusion. Laboratories participating in external proficiency testing programs maintain a high level of performance. These programs are useful in monitoring lab performance and allow comparison with others using similar methods and reagents.

E.731

PSYCHOLOGICAL IMPACTS OF INDETERMINATE HIV WESTERN BLOTS.

Connie Celum*, Vitaliano, PP*, Lafferty, WE**, Roberts, PL*, Holmes, KK*, Inui, TS*. *Univ of Washington,**Washington DSHS., U.S.A.

Objective. Indeterminate results on Western blots pose a problem for both patients and providers due to the lack of information on the epidemiology of indeterminate Western blots (IWB). We conducted an ongoing prospective study to characterize anxiety, depression, coping processes, and specific concerns related to IWB.
Methods. Thirty-seven individuals with positive HIV ELISAs and IWB were referred from diverse HIV testing sites in Washington state (80% from low and 20% from high-risk groups) and voluntarily participated in a prospective study. Standard instruments were used to measure depression (Beck Depression Inventory), anxiety (Symptom Checklist-90), coping (Ways of Coping Checklist), and the psychological impact of IWB.
Results. Seventeen individuals were tested for HIV because of concern over past sexual exposures (4 homosexual,13 heterosexual), 4 because of intravenous drug use, 11 as blood donors, 4 as applicants for life insurance, and 1 in the military reserves. Cases reported considerable anxiety and depression in semi-structured interviews and the Beck and SCL-90 measures. Coping by self-blame and avoidance (denial) were significantly correlated with anxiety (r=.44 and .32, respectively, $p<0.05$). Adverse life events attributed to the IWB included consideration of termination of a first trimester pregnancy, use of the IWB in a custody case, ineligibility for life insurance, marital distress, and the decision to drop out of medical school. Informational needs included explanation of ELISA and Western blot techniques and results, discussion about the low rates of seroconversion in low- risk individuals with IWB, possible etiologies other than HIV, and options for further evaluation.
Conclusions. Counselling of individuals with IWB should include assessment of anxiety, depression, coping processes, the attributed consequences of IWB, and should provide information about HIV testing techniques and options for further evaluation.

E.732

ViRx: A PRIVATE SECTOR MODEL PROGRAM TO PERFORM COMMUNITY BASED CLINICAL DRUG TRIALS

Anderson, Robert E.*; King, D.**; Lang, W.*; Haseltine, P.***; Johnson, K.; Deleage, J.****.
*ViRx, Inc., San Francisco, CA, USA; **Oclassen Pharmaceutical Co., Corte Madera, CA, USA; ***LAC-USC Medical Center, Los Angeles, CA, USA; ****Burr, Egan, Deleage & Co., San Francisco, CA, USA.

Objective. To establish a private sector model program for rapidly enrolling HIV seropositive study subjects and conducting clinical trials.
Methods. The combination of an ongoing monitoring program for HIV seropositive patients, a patient registration system for primary care physicians, and direct advertising in target media reaching high HIV prevalence populations was developed to facilitate registration and subsequent enrollment into IRB-approved clinical trials. Startup funding was provided by a venture capital firm with ongoing support from pharmaceutical sponsors.
Results. Use of advertising in target media appears to be most effective in registering patients and filling studies with simple entry criteria. A candida prophylaxis study with 30 patients was 82% subscribed in less than 90 days by such advertising. Ongoing monitoring programs require treatment or primary care as additional patient motivation.
Conclusion. A private sector model program has been established in San Francisco to efficiently conduct sponsored clinical trials. This program augments the current system of university-based programs, Community Research Initiatives and County Consortia, and differs in the use of a dedicated research facility and private funding for startup and ongoing support. Initial response from industry and patients has thus far been favorable.

Media

E.733

DIGNITY CANADA DIGNITE AIDS PASTORAL CARE PROJECT

Roy, M.S.W., Charles M.,* and Simon, R.E.C.**
* National Director, Dignity Canada Dignité,** AIDS Committee Chairperson, Dignity Canada Dignité

What is "pastoral care"? Is it relevant to people dealing with AIDS? What forms can it take? Who is qualified to administer it? Who is eligible to receive it? These were the fundamental questions asked by the Dignity Canada Dignité AIDS Pastoral Care Project. Furthermore, the Project was interested in determining the expectations of actual and potential "users" with an eye to indicating the directions for development of more responsive pastoral care initiatives.

Data was collected by means of a self-administered questionnaire made available across Canada in two languages. The tabulated results indicated wide-ranging answers to the Project's fundamental questions. Persons receiving or wanting to receive pastoral care were not to be limited to persons actively ill with AIDS, but included as well the asymptomatic, the family and friends of the presently and potentially ill, and also AIDS caregivers themselves. Those perceived as "givers" of pastoral care were not only the recognizable representatives of organized religion, but again family, friends and caregivers as well. The forms (both experienced and hoped for) of pastoral care related to AIDS ranged from traditional ones like preaching to the development of public policy by religious institutions. The need for persons sensitively informed and specially trained in dealing with AIDS was indicated. And the need for counselling was especially emphasized, with an array of specific "issues" (e.g., pain, suicide, grief) demanding particular focus.

Tous les renseignements sont disponibles en deux langues.

E.734

AIDS AND SPIRITUALITY: LIVING IN THE FACE OF DEATH

Carol L. Huntington,ACSW,LICSW, University Hospital University of Medicine and Dentistry of New Jersey, Newark, N.J. , Associate Minister, Christ Episcopal Church, Teaneck, N.J., U.S.A.

Objective. The AIDS social worker is faced with the dilemma of incorporating spiritual issues into traditional clinical intervention strategies.
Method. This paper is based on clinical observation gained in social work practice with AIDS patients at University Hospital in Newark, N.J. and pastoral counseling as a professional in the Episcopal Church. Most of my patients are IV drug abusers. Some are gay men or have been infected with HIV as a result of heterosexual relations. They are different, yet are open, honest people of faith, courage, and love.
Results. AIDS social workers are in a unique position to address appropriately the needs of a person who presents with a spiritual crisis. This paper examines what is appropriate for the social worker to do, what is not appropriate, and when, to whom, and how to refer. It looks at the positive and negative aspects of spirituality and how social workers can best respond to statements and questions of faith.
Conclusion. It is in that response that we are most able to help patients seek life in the face of death. Social workers are challenged to confront spirituality, strengthen it and use it therapeutically in social work practice with AIDS patients.

E.735

MEDIA MESSAGE (PROTECT YOURSELF AND EACH OTHER)

Smith, Linda; Seaborn, J.; Lathrop, L.; Boyack, D.
Calgary, Health Services, Calgary, Alberta, Canada

Objective. Young adults, not associated with a school or institution are a difficult audience to access with health information. Positive messages about the use of condoms to prevent pregnancy and STD's including AIDS, are particularly important for this age group which has high STD and unwanted pregnancy rates. There are few positive media images on how to use condoms, who purchases them, or how to talk about using them with a partner.

Methods. To promote the messages of **dual responsibility** and need for **dual protection** against pregnancy and STD including AIDS, four Public Service Announcements (PSA's) were developed (30 seconds each) for television.
Results. Approval was received from the telecaster Committee of Canada for use as Public Service Announcements. Four out of five television stations in Calgary area are airing the PSA's. This is the first time a condom has been presented as part of a public health message in Canada.

Conclusion. A small outlay of funds ($15,000.00 Cnd.) produced a top quality product. One of the four spots won the #1 Public Service Announcement in its category in Canada. Innovative, positive (media) messages including modelling of behavior are conducive to enhancing the knowledge base and preventive practices of the young adult.

E.736

NOTES ON MTA POSTERS: WHAT ARE THEY REALLY SAYING?

Ben-Levi, Joseph M., Oberlin College, Princeton, N.J., U.S.A.

Objective: This study examines several recent Mass Transit Authority (NYC) advertisements for the rhetorical expression of ideological developments around AIDS, many of which have been documented by Simon Watney. This paper clarifies the relations between the MTA images and the cultural formations which they, obliquely, refer to. Their use of such tropes as the violation of the 'family,' the femme fatale, danger in unexpected places, etc.,illustrates the widespread psychic displacements occuring, where symbols of fear prevalent aroundAIDS serve in other contexts.
Methodology: The study emplys semiotic analysis to reveal these ads' rhetorical structures, while foregrounding the importance of social context in interpreting representation.
Results: The study found that these advertisements reinforce an underlying climate of unease which reflects displaced phobias around AIDS.

E.737

MEDIA DISTORTIONS OF AIDS: NINE YEARS OF MISPERCEPTION

Signorile, Michael*; Voelcker, J.**

* Chair, Media Committee, AIDS Coalition To Unleash Power (ACT UP), New York, N.Y., USA.
** Member, Media Committee, AIDS Coalition To Unleash Power (ACT UP), New York, N.Y., USA; freelance science writer.

Objective. To present a survey of media coverage of the AIDS epidemic and identify inherent biases and misinformation.
Methods. Both television and print media were analyzed; different reports on the same events were compared; points of view that were not mentioned were highlighted.
Results. While coverage of the scientific aspects of AIDS by the world's media has become more accurate over the course of the epidemic, it still lacks any real attempt to provide adequate social perspectives. The views of people with AIDS are rarely if ever taken into account, and most scientific evidence is taken at face value, with insufficient analysis and context provided. Methods have been created to remedy these problems, and to provide a more accurate and more rounded perspective on the global AIDS epidemic and the many complex issues that surround it.
Conclusion. A decade of media coverage of the AIDS epidemic shows that balanced and educated reporting is rare.

E.738

AIDS AND THE MEXICAN PRESS.IS IT USEFUL AS AN EDUCATIONAL MEAN?

Guzmán, L.*; Blanca Rico*; Magis, C.**, and Rangel, G.*
*The Regional Center for Exchange, Documentation and Information about AIDS, CRIDIS/CONASIDA, MEXICO.
**General Directorate of Epidemiology. Ministry of Health, MEXICO.

Objectives. 1)To analyze the response of the Mexican press to the AIDS epidemic from April to December 1988; 2)to evaluate the role of the Mexican press as an educational mean; 3)to evaluate the public opinion response to the educational campaign against AIDS.
Methods. Notes and articles were collected from the eleven most important national daily newspapers. Each note was considered as an analysis unit, and quantitative variables were captured and analyzed using a SPSS-PC programme. For the qualitative variables content analysis was used. The variables allowed us to know the frecuency and the way the Mexican press is dealing with AIDS.
Results. The most relevant results are: 1) the average number of articles was 9.9 per day; 2) the information flow increased after the AIDS official campaign, because of the public opinion response; 3) the social groups that expressed an opinion related to the campaign were: public organizations 59.7%, social associations 20.6%, civil associations 11.8%, political parties 3.6%, religious institutions 3.6%, and private organizations 0.5%;4) in regard to the article content, 2.6% were about transmission; 4.7% about treatment; 18.2% had epidemiological information; and 40% about the response of the public to the preventive measures the campaign proposed.
Conclusions. Although articles are being published constantly, the press is not acting as an efficient educational mean. Nevertheless, results show that the public opinion has respond significatively, and so we consider that special strategies must be design in order to make the press a useful mean. The social discussion in this medium should be considered by the decision makers to orient the following steps of the campaign.

E.739

AIDS IN SWISS-NEWSPAPERS: REPORTING OF PREVENTIVE EVENTS AND DESIGNING THE IMAGE OF AIDS.

Birchmeier B.*; Richard J.E.*; Hausser Dominique**; Dubois-Arber F.**; Lehmann Ph.*
* Dpt socio. uni. Genève; ** Inst. univ. de méd. sociale et préventive, Lausanne, Suisse.

More than 1500 different newspapers are printed in Switzerland.
Since 1986 the Swiss authorities have launched a multimedia campaign under the slogan STOP-AIDS, associated with an important effort of stimulating multipliers such as regional authorities, schools, social and health professionals.
Objectives. Analyses of the 3776 articles about AIDS printed in 445 newspapers between Jan and Oct 1988 have 3 goals: 1. As a source of information about local actions, political facts or decisions, discriminative reactions in the different part of the country. 2. To describe the image of AIDS designed by press. 3. As a databank.
Results. The main conclusions are :

- AIDS has been treated as any other topic by the press, but appears much more often and more regularly than the others (media report live every events and newness of scientists concerning AIDS).
- The press play a major role in designing popular beliefs about AIDS.
- Most reported events are not directly related to prevention but still have preventive effects.
- Persons with AIDS take a large place and are presented as "usual" patients who need care and compassion.
- Journalists are generally neutral, but don't take much care of contradictions appearing in or between the agencies'news.

E.740

Lakeshore School Board's Comprehensive Aids Model

Mitchell, Margaret; Bolt, William
Lakeshore School Board, Beaconsfield,
Quebec, Canada

Objective. To describe the implementation of a comprehensive plan on AIDS which included the development of a policy, school board plan for high school students, professional development for teachers, a community development strategy and a public awareness component.
Methods. A report will be presented on the results of the Lakeshore School Board's mandate to develop a policy and an educational plan on AIDS. The LSB-AIDS Committee with representation from every group organized fifteen major information sessions, and seventeen large group assemblies using flyers, brochures, informative letters, education kits, videos, and newspaper and television coverage in the undertaking.
Results.Approximately 1200 employees, 1300 parents, and 4000 high school students were given the opportunity to learn about the deadly disease, AIDS. Newspaper and television coverage gave the Lakeshore School Board positive publicity to the importance of this topic. Students' essays and projects offered encouraging feedback to the teachers and parents; comments were most reassuring that the committee must continue its work.
Conclusion. The Lakeshore School Board has proven that a grassroots venture without funding can have a transforming effect on the attitudes of its community members and high school students. The Committee is committed to continue to educate its people about the magnitude of the disease. The AIDS program is being placed in the context of family life/human sexuality curriculum this year. With organized human resources, great strides can be made. These findings will be available for the Congress.

E.741

SIDA ET MEDIA AU SENEGAL
Desgenais Bernard, Université Laval, Québec, Canada.

Objectif. Connaitre l'image que véhiculaient les médias sur le SIDA au Sénégal au moment du développement du Progamme national à Moyen Terme de lutte contre le SIDA.
Méthode. Analyse des articles parus dans le Soleil de Dakar, au Sénégal, de 1986 à 1988.
Résultats. Entre le moment où le Soleil titrait à la une le 20 février 1986: SIDA: AUCUN CAS AU SENEGAL et l'article du 4 juin 1988 où le Soleil faisait état de 84 cas de SIDA recensés au pays, l'analyse de la couverture de presse nous livre les séquences suivantes:
- Il n'y a pas de SIDA
- Les cas de SIDA viennent d'ailleurs
- Les médias dramatisent
- Le SIDA se développe
- Les premières préoccupations sont d'abord bio-médicales
- Le SIDA n'est pas la seule urgence en matière de santé.
- Il faut combattre le SIDA.
- Les dimensions psycho-sociales de la maladie.

Conclusion: L'étude comparative de la couverture de presse du SIDA en France dans le Nouvel Observateur et au Québec dans le Soleil démontre que le pattern sénégalais se retrouve dans tous les pays qui prennent conscience du développement de la maladie sur leur territoire.

E.742

"Asian women and AIDS - research issues"

submitted by Soon-Young Yoon, PhD anthropologist, INDIA

This paper identifies research issues on "Asian women and AIDS". It points out that current Information/Education for Health strategies used to educate prostitutes and women about AIDS are often oblivious to the main problem of women and health — women's powerlessness . Sex tourism contributes to the vulnerability of women to AIDS, particularly as many prostitutes are children. At home, women are victims of "shame cultures" and double standard values which put them in a communications "purdah" or veil. Even when confronted with health information about sexuality, they are not supposed to acknowledge it with a behavioural change such as asking husbands to wear condoms. Efforts to mobilize women's groups at community level can brighten the picture but these have yet to have widespread support. The paper identifies a number of research/action areas which would help AIDS programmes to support women who are struggling to lift this communications "purdah".

E.743

THE EMOTIONAL IMPACT OF NEEDLESTICK INJURIES ON HEALTH CARE WORKERS
Marrie, T; MacIntosh, N; Streight, R; Schlech, Walter, Dalhousie University, Victoria General Hospital, Halifax, N.S., Canada

Objective. To determine if a needlestick injury has an adverse emotional impact on health care workers (HCW's).
Methods. Self administered questionnaire at the time the employee reported the injury and a supplemental questionnaire was completed two weeks following the injury.
Results. To date 54 HCW's have been enrolled. Seventy-four percent of the injuries involved contaminated needles. Two incidents involved patients with group IV HIV infection and 2 involved patients with hepatitis B. Immediately after the injury 74% felt the risk of developing HIV infection was low. At two weeks following the injury, 49% were worried about developing an infection; 18% had lost sleep due to worry and 9% had a change in appetite. The "feelings" regarding the accident consisted of anxiety - 40%, anger at one's self - 18%, depression - 2%. One person had a decrease in sexual activity and another changed her method of contraception to condoms following the injury. Eighty-two percent discussed the accident with co-workers; 53% with his/her spouse; and 5% with their family physician.
Conclusion. The preliminary results of this study indicate that needlestick injuries have a significant emotional impact on health care workers. Our data suggest that occupational health departments, in addition to programs to prevent such injuries, must recognize and deal with the emotional impact of such injuries.

E.744

TITLE: THE WORKPLACE: LARGE ADVANCES FOR SMALL BUSINESSES
Schwartz, Beverly; Williams, K. R.
U.S. Centers for Disease Control, Atlanta, Georgia, USA

Objective. This paper identifies and discusses leverage points, motivating factors and programs successful in stimulating small businesses to educate employees about the prevention of HIV.

Methods. Needs assessment surveys have been used as the basis for designing education strategies responsive to small business needs and capacities. Professional membership organizations consisting of small business owners were enlisted to assist in the development of program content, structure, and initial implementation of the project's pilot phase.

Results. The programs offered unique perspectives and approaches in identifying applications to a multiplicity of organizational structures. Evaluation methodologies for program usage by employers and impact on employees knowledge level and behavior will be discussed.

Conclusion. The worksite must be acknowledged as a vital target area, and utilized as a primary vehicle for communication of adult Aids education and prevention programs. Indeed, the development of usable programs for this population appears to be a most important step in reaching a large segment of individuals who may effectively be reached only through their place of employment.

E.745

HEALTH PROFESSIONAL'S KNOWLEDGE, EXPERIENCE AND ATTITUDES CONCERNING AIDS IN RELATION TO ANXIETY ABOUT CARING FOR INFECTED PERSONS Durkin, Joan; Albrecht, G.; Cooksey, J.
University of Illinois at Chicago, U.S.A.

Objective. The AIDS epidemic has caused considerable anxiety among health professionals. Areas with high incidence have reported employee loss, avoidance by medical students of certain hospitals and/or specialities, and high employee stress among those who stay. It is important to be able to discriminate those variables associated with anxiety in order to develop effective workplace response to reduce fears, insure quality care, and retain personnel.
Methods. In this study, 536 physicians, nurses and social workers at University of Illinois Medical Center were surveyed and compared to ascertain the relationship between their knowledge attitudes, and experience concerning AIDS in relation to caring for infected persons. Knowledge about AIDS was measured by self-rated knowledge level, and actual accurate knowledge. Experience included frequency, type, and level of contact with infected persons. Attitude variables included willingness to work on an AIDS unit, treating patients on a special unit, and obligation to treat persons with AIDS. Anxiety included by worry and about patients with AIDS, infection through their work, and infecting their families.
Results. Overall, attitudes were stronger indicators of anxiety than were knowledge and/or experience for physicians and social workers. For nurses experience with patients was also significant.
Conclusion. Professional role and responsibility must be addressed in the workplace in conjunction with worries about AIDS in order to facilitate reduced anxiety about caring for patients.

E.746

ATTITUDES OF MEDICAL TECHNOLOGISTS TOWARDS THE ACQUIRED IMMUNODEFICIENCY SYNDROME.
Brown, James W.[''], Feeney, K.B.['], and Gauch, R.[']. Roche Biomedical Laboratories[''], Raritan NJ, Fairleigh Dickenson Public Administration Institute, Rutherford NJ, . U.S.A.

Objective. To assess the degree of concern medical technologists have towards the acquired immunodeficiency syndrome. Methods. We surveyed attendees at the annual meeting of the NJ Society for Medical Technology held in Asbury Park, New Jersey during April 1988. The survey addressed concerns, attitudes, knowledge, and practices of medical technologists with respect to AIDS. Multiple choice questionnaires (283), utilizing a Likert scale, were distributed and a 74.9% response was obtained. Results. Of those surveyed, 85.6% have friends or families who expressed concern about working with HIV positive samples; 25.9% are considering leaving the profession because of their fear and/ or their "significant other's" fear of acquiring HIV in the laboratory; 65.2% would not have chosen the field of medical technology knowing they would be handling HIV positive samples; 72.0% currently wear gloves either most of the time or always when handling samples. Conclusion. We found a high degree of concern about AIDS among technologists. This may be a factor contributing to the current personnel shortage in medical technology.

E.747 AIDS-RELATED KNOWLEDGE ATTITUDES AND PRACTICES OF GREEK DENTISTS

Anastasia,Roumeliotou;Kossyphidou,J.;Konstantinidis,R. and Papaevangelou G.
National Center for AIDS,Athens School of Hygiene,Athens Greece

Objective.To estimate knowledge attitudes behaviour and practices related to AIDS of dentists in Greece and determine responsible factors.
Methods.An anonymous questionnaire was sent my mail to a randomly selected 10% sample among dentists in Athens.Details about their demographic and scientific background, prophylactic measures during their occupation and practical knowledges about AIDS were asked to be completed. Of the 349 who received the questionnaire 71.3% participated in the study.
Results.Of the participated dentists 55.4% were males, 61.5% were less than 40 years old and 18.5% admitted post graduate studies.More female(43.6%)than male(37.0%)dentists always use gloves. The use of gloves and masks was higher in dentists less than 40 years old(48.4% and 34.9% respectively) than in those more than 40(26.3% and 18.7). Of the Greek dentist 64.2% disinfect the high speed hand piece after treatment of every patient.Only 38.5% accept the therapy of HIV infected patients while 80.5% were well informed about AIDS.
Conclusion.High proportion of Greek dentists take precautions for themselves and their patients,are well informed about AIDS but are not willing to therapy HIV infected persons. More education is necessary to improve their practices and behaviour.

E.749 AIDS and Refusal to Work: A Canadian Experience

Regenbrecht, Merlies
Labour Canada, Occupational Safety and Health, Ottawa, Ontario, Canada

Objective. To describe the process of assessing refusals to work because of danger, when the danger consists of a co-worker or client with AIDS.
Methods. Cases of refusal to work,because of a co-worker with AIDS, in the federal jurisdiction are reviewed and the ruling explained. Comparisons are made with cases in other Canadian jurisdictions.
Results. Up till now refusals to work because someone in the workplace has AIDS, have not been upheld.
Conclusion. Fear of contracting AIDS is a potent motivator for refusing to work with someone who has been infected, even when the contact with the infected person is minimal. Dissemination of information about the disease and its spread would prevent many of those incidents.

E.751 RECOMMENDATIONS FOR AN AIDS WORKPLACE POLICY

Katoff, Lew, Gay Men's Health Crisis,
New York, New York, USA

Objective: To provide suggestions for human resource policies for organizations involved in AIDS social services, research and education.
Methods: The role of institutions involved in AIDS services and research in addressing the issues of persons with AIDS in the workplace were considered.
Results: AIDS service and research organizations have the capacity and the responsibility to serve as models for employers in their communities, as well as a responsibility for the well-being of their employees. Demonstrating that persons with AIDS can and do continue to lead productive lives contributes to the creation of communities in which a diagnosed person can live fully. While difficult and costly, attention to AIDS in the workplace has important benefits for affected employees, their co-workers, the organization and the larger community. The involvement of the person with AIDS may enhance the effectiveness and sensitivity of education, research and support services. Most important, fair and effective treatment of HIV-infected employees provides a model of compassion and sensitivity.
Conclusions: Recommendations for establishing a relevant, effective PWA personnel policy include consideration of reasonable accomodations, employee benefits and the availability of support services.

E.748 A MODEL APPROACH FOR LABOR UNIONS AMID THE HIV EPIDEMIC IN ALAMEDA COUNTY, CALIFORNIA

Jefferson, Frances*; Seidel, E.**; Cross, B.***; Labor and Occupational Health Program (LOHP), University of California at Berkeley; East Bay AIDS Response Organization; and Service Employees International Union (SEIU) Local 250
*SEIU Local 616, Oakland, California, USA, **Highland General Hospital (HGH), Oakland, California, USA, ***HIV/AIDS Services Division, Alameda County, California, USA

Objective: To describe a public sector labor union's workplace efforts in directed HIV educational programs and in creating and expanding HIV services in Alameda County, CA.
Methods: SEIU Local 616 has organized a collaborative effort utilizing union, community, and county government resources to educate the county's workforce; to expand HIV clinical services; and to improve access to quality care.
Results: 1) Shop steward training in HIV transmission, occupational safety, and education/prevention. 2) Collaboration with hospital management at Highland General Hospital in training all workers regarding HIV transmission, prevention and workplace safety. 3) Organize a Gay and Lesbian Caucus within Local 616 to address HIV and other issues in the workplace. 4) Political action around HIV funding allocations. 5) Establishment of HIV outpatient services at Highland General Hospital.
Conclusions: Labor unions can organize and reinforce workplace education efforts; lobby local government to support comprehensive HIV services; and provide a focus for important gay and lesbian, minority, and community concerns.

E.750 AIDS EDUCATION IN THE WORKPLACE

Ray-Keil, L.*; Downer, Ann **
*Seattle/King County Department of Public Health, Seattle, Wa., USA; **University of Washington, Seattle, Wa., USA.

Objective. To educate the King County workforce about AIDS, and to evaluate the effectiveness of this training on knowledge and attitudes.
Methods. As part of a county-wide policy on non-discrimination for people with AIDS (PWA) in the workplace, a voluntary AIDS educational was offered to all county employees on work time. The one hour sessions consisted of an oral presentation, a videotape and a question and answer period. A pre and post test was administered to the first 1000 participants.
Results. Approximately half of the 5000 person workforce chose to attend one of the 70 presentations given in 1988. In general, those surveyed showed a high degree of basic knowledge about AIDS. For instance, over 97% answered correctly on the pre test that a person risks infection by sharing intravenous drug equipment, that women can pass the virus to male sexual partners, and that an infected pregnant woman can pass the virus to her unborn baby. Areas in which there was less knowledge included: the ability of bleach to kill HIV, the safety of sharing eating utensils with a PWA, the risk of infection from blood transfusions, and the safety of latex condoms compared to natural skin condoms. An average of 59% correctly answered these questions on the pre test. After the presentation, an average of 89% answered correctly. Those who would not work with a PWA decreased from 40% before to 24% after.
Conclusions. A one hour educational can significantly increase knowledge about AIDS and alter attitudes about working with a person with AIDS.

E.752 FEAR OF AIDS IN THE WORKPLACE

Sy.Francisco;Richter,D;Mathur,S and Addy,C.
University of South Carolina School of Public Health, Columbia, South Carolina, USA

Objective. To determine the level of fear and misconceptions about AIDS in the workplace.
Methods. 990 employees in a major university in southeast U.S. responded to a university-wide AIDS survey. The measurement instrument used was a questionnaire with questions regarding their general knowledge and personal attitudes related to AIDS. Data on demographic information and job position were also collected. A general knowledge score and an attitude score were calculated for each subject.
Results. 32% were 'very concerned' in the situation 'being served in a restaurant by a person infected with the virus'. 30% were 'very concerned' being 'near an infected person while they sneeze or cough'. 24% were'very concerned' in 'using an infected co-worker personal belongings', and 22% from 'drinking from a water fountain used by an infected person'. Staff non-supervisors had a higher level of fear and concerns about AIDS. The irrational fears maybe due to the misconceptions about AIDS and to the fear of contagion, fear of unknown and fear of death.
Conclusion Fear of AIDS in the workplace exists due to various misconceptions about AIDS. Extensive AIDS educational efforts must be conducted to provide facts and to calm down fear and hysteria which may disrupt the workplace.

E.753

HIV/AIDS AND INTERNATIONAL ORGANIZATIONS: A STAFF AND DELEGATE EDUCATION PACK

Breuer, Nancy L. American Red Cross, Los Angeles Chapter,
2700 Wilshire Boulevard, Los Angeles, California 90057, U S A

Objective: To describe the process and present a sample of the result of development of a multicultural HIV/AIDS basic education and anti-discrimination pack for use by international organisations.

Working in the Secretariat of the League of Red Cross and Red Crescent Societies in Geneva, and in cooperation with WHO, the author has involved League staff members and staff from other Geneva-headquartered non-governmental organisations to develop an appropriate educational programme for staff members and field delegates in international service.

Results: The resulting pack includes a self-questionnaire, scripted slide presentation, case studies, exercise on non-discrimination, interviews with persons undergoing the HIV test in Geneva, resource list, workplace HIV bibliography and the newly-developed League HIV/AIDS policy for the workplace.

Conclusion: League of Red Cross and Red Crescent Societies has a tested programme designed to help staff and delegates work appropriately with HIV issues in their workplaces and prevent HIV/AIDS-related discrimination.

It's Your Job: A Three-Part Plan To Control Infectious Disease

Miller, Dr. W. Barry
Director of Education, Fredericton, New Brunswick
Canada

Objective: To explain how a school system has informed employees of the basic public health principles that govern infectious disease control in schools.

Methods: A sixteen page brochure has been prepared for all school board employees. It provides specific direction under such headings as How Should I Deal With AIDS In The Classroom?, How Can I Protect Myself Against AIDS?, What You Don't Have To Worry About.

The document provides a model for any school system that is concerned about providing accurate information to their employees. The publication has been endorsed by the Canadian Public Health Association. The publication will be available in limited quantity.

E.757

THE SAFE HANDLING OF HIV-POSITIVE BIOLOGICAL FLUIDS IN THE ANALYTICAL CHEMISTRY LABORATORY

P.A. Lewis and D.B. Garcia Radian Corporation, U.S.A.

Although biological fluids have long been handled in the analytical chemistry laboratory, official guidances relative to their safe handling have only recently been disseminated by the U.S. Occupational Safety and Health Administration (OSHA). While the possible exposure to etiologic agents has always been present, greater concern has surfaced as a result of the AIDS epidemic. Further, the need for analytical chemistry laboratories to handle biological samples from AIDS clinical research trials presents a special case since all samples are known to be HIV-positive. Presently there is much reluctance by laboratories capable of conducting drug disposition studies to handle known HIV-positive samples and thus we have designed containment facilities and developed standard operating procedures (SOPs) for these activities. The containment laboratory used for this activity operates under negative pressure and is governed by a series of SOPs. The SOPs address the following activities.

- General work practices, policies, and procedures;
- Packaging and transporting of specimens;
- Receipt and transfer of specimens to sample control;
- Sample log-in and storage;
- Laboratory clean-up, decontamination, and disposal;
- Emergency procedures for surface spills and personal contamination; and
- Decontamination of biological waste.

In addition to the general SOPs above, a safety protocol relative to the specific analytical procedure to be performed is formulated. This protocol focuses on possible hazards peculiar to the analytical procedure.

E.758

THE IMPACT OF AN AIDS EDUCATION PROGRAM IN THE WORKPLACE

Sy. Francisco;Richter,D;Mathur,S and Addy,C.
University of South Carolina School of Public Health, Columbia, South Carolina, USA.

Objective. To measure the effectiveness of an AIDS education program for employees in a university workplace.
Methods. A university-wide AIDS education program was implemented in a major university in southeast U.S. from January-May 1988. 990 employees, grouped according to their job positions, attended two-hour AIDS education sessions conducted by a medical epidemiologist and a health educator. Pre and post test questionnaires, consisting of knowledge and attitude questions, were completed by the participants. Pre and post test scores were calculated for each employee. Data were analyzed using the chi-square test, paired t-test, and ANOVA.
Results. Before the educational program, the mean knowledge score was relatively high. There were misconceptions regarding the cause, cure and transmission of AIDS. Many employees were concerned about getting AIDS in low or no risk situations. After the program, there was statistically significant improvement in both knowledge and attitude scores of the employees.
Conclusion. This AIDS education program in the workplace was found to be effective with improvement in both the knowledge and attitudes about AIDS among the employees.

E.759

Blood Control in Brazil

Jurberg, Claudia; Galvão, Bernardo; Silva, Edmilson*
Oswaldo Cruz Foundation, Rio de Janeiro, Brasil

Objective. To realize an analysis, together the brazilian authority government, the population and together the press in general, about aids transfusional brazilian situation. What is the government actuation ? The brazilian press contribued with the elucidation the problem ? And the population have conscience the important of voluntary blood donation ?
methods. It is an work of scientific journalism with objective is, trhough interviw with authority government, cientist, technical science, journalist and the population, establish the blood control situation in Brazil, during a period.
results. A new brazilian constitution, promulgated in 1988, prohibit a blood sale, but any government measure will be realize. The blood have been saling and the brazilian population ignore the danger with blood transfusional.

Prévention et santé publique
Prevention and Public Health

E.760

DRUG REGULATION GONE WRONG: THE SAGA OF GANCICLOVIR

Eigo,James; Long, I.; Harrington, M.; Fornataro, K. AIDS Coalition to Unleash Power, New York, New York, USA.

Objective. To evaluate flaws in the current drug approval process in the U.S. through analysis of the "ganciclovir story".
Methods. An analysis of all the anti-cytomegalovirus (CMV) ganciclovir protocols, of published data on ganciclovir and of the minutes of the Food and Drug Administration (FDA)'s Anti-Infective Drug Advisory Committee and interviews with opthamologists and people who have CMV.
Results. In October 1987, the FDA's Anti-Infective Drug Advisory Committee, ignoring the advice of its two opthamologist members, voted to recommend against marketing approval for ganciclovir to treat CMV retinitis in immune-suppressed people. It did so even though evidence gathered under a "compassionate use" protocol showed ganciclovir to be 80% effective in improving CMV retinitis, which is a severe, progressive disease that leads to blindness in nearly 100% of untreated patients. The vote, in effect, mandated a controlled clinical trial to establish the drug's efficacy. The trial began in January 1989.
Conclusion. Ganciclovir, proven effective against CMV retinitis, should have been approved in October 1989. Efficacy trials for a drug that has been proven effective waste resources, put patients at indefensible risk, and limit access to an effective therapy.

E.761

A MODEL OF COMMUNITY SUPPORT FOR PEOPLE WITH HIV DISEASE

Margolese,E.*; McKenna,P.**; Rohl,M.**; Newman,J.**; Lemire, A.**, Turner,R.**. *Coordinator, AIDS Community Care Montreal (ACCM). ** Administrative Council, ACCM. CANADA

Objective: To provide community based, psychosocial and practical support to people affected by HIV.
Method: Developing, writing and publishing a comprehensive layman's guide to coping with HIV related conditions.Providing one to one support by trained volunteers, counselling, self help support groups, an information library and emergency financial assistance.
Conclusion: This type of support is beneficial and helps people cope both physically and emotionally with HIV related illness.
Results: We maintain an average of twenty clients at a time, indicating a strong need for this type of program.

E.762

SIDA ET SOCIETE: REFLEXIONS SUR LA PRATIQUE ANTHROPOLOGIQUE INTERNATIONALE

Schoepf, Brooke Grundfest
Woods Hole, MA USA

Objectifs. Reflexions sur la pratique des anthropologues répondant à la situation critique causée par l'extension du SIDA.
Méthode. Observation-participante dans des congrès scientifiques, des causeries entre collègues et des recherches sur le terrain en tant qu'individu et chef d'équipe.
Résultats. La crise du SIDA offre aux anthropologues un terrain privilégié pour avancer la production des connaissances. On y mène des recherches sur le processus des changements sociaux, les rapports entre la maladie et la société, l'économie politique et la culture, la persistance des structures et représentations et d'autres thèmes fondamentaux. On pourra y vérifier théories et modèles et tenter de nouvelles approches méthodologiques. Certains entendent contribuer à la recherche des solutions aux problèmes de prévention. Qu'elles soient conçues comme recherche de base ou d'application, les recherches sur le SIDA présentent une série de contradictions qui soulève des problèmes de déontologie et de responsabilité professionnelle.
Conclusion. La pratique de l'anthropologie est une action sociale par excellence qui met les chercheurs devant des choix parfois difficiles et même à des réflexions critiques.
Mots clefs: déontologie, responsabilité, reflexivité, anthropologie

E.763

DIFFERENCES IN AIDS RISK ASSESSMENT (ARA)/COUNSELING BEHAVIORS OF PRIMARY CARE PHYSICIANS IN COSTA RICA AND HARRIS COUNTY, TEXAS

Coverdale, John; Vallbona, C., Laux, L., Aruffo, J., and Thornby, J.
Baylor College of Medicine, Houston, Texas, USA.

Objective: To assess whether there are significant differences in attitudes and ARA/counseling behaviors of Costa Rican and Harris County physicians.
Method: In this study, we obtained responses from 48 Costa Rican physicians at a medical conference to questions we had previously used to assess the ARA/counseling behaviors of physicians in Harris County Community Health Centers. The questionnaire was translated into Spanish by one of the co-authors who attended the meeting. These responses were compared to the responses of 47 primary care physicians from the health centers using the general linear model program of SAS.
Results: Significant differences (p < or = .05) were found on 22 of the 43 questions. Costa Rican physicians report being more comfortable asking patients about their sexual preferences and practices and that they counsel patients on how to reduce their risk of AIDS at a substantially greater rate than Harris County physicians. Costa Rican physicians also report feeling more responsible for ARA/counseling.
Conclusions: There are cultural differences in physician behaviors and attitudes about sexual and drug history taking and counseling which may reflect differences in medical training as well as cultural differences in attitudes about appropriate physician behavior.

E.764

IMPACT OF A SLIDE ASSISTED PRESENTATION ON THE KNOWLEDGE ABOUT HIV-INFECTION IN INSURANCE EMPLOYEES

Fussel, Hermann, Schreiber MA, Bogner JR, Matuschke A, Heinrich B and and Goebel F-D. Medizinische Poliklinik der Universitat, 8000 München 2, FRG

Objective. To assess the present knowledge about AIDS in insurance employees and to investigate the effect of a single educational talk..
Methods. A questionnaire with 10 questions concerning AIDS was filled in by 192 insurance employees before and after a slide assisted presentation on relevant items of HIV transmission. The results were compared by χ^2 test.
Results: 190 and 185, respectively, of the questionnaires were returned. The percentage of wrong answers before and after (%/%) the presentation were: 1. You can get AIDS being in the same room with a person with AIDS (1/1) NS. 2. AIDS has been transmitted through sharing office equipment (3/0) NS. 3. The virus which causes AIDS has been transmitted through saliva (52/7) p <0.0001. 4. AIDS is transmitted by sneezing (5/1) p <0.01. 5. AIDS is an easily transmitted disease (21/8) p <0.001. 6. There are reports of casual transmission of AIDS to family members who are not sexual partners of people with AIDS (31/19) p <0.01. 7. People can look and feel healthy and still transmit the virus (5/7) NS. 8. If you inject drugs with your own needle and never share it you cannot get AIDS from shooting drugs (14/7) p <0.025. 9. You can get AIDS from donating blood (46/16) p <0.0001. 10. There is a vaccine to prevent AIDS (1/1) NS.
Conclusion: There is still a considerable lack of information even among educated middle class people. Slide assisted presentations may have a significant impact on the knowledge about HIV transmission.

E.765

AIDS AS A PROCESS

Conde, F.; Coronado, A.*, Arredondo, C.*, Gil, E.*.
Ministery of Health.-Spain.

Objective. AIDS is not a unique and irreversible fact, but rather a process in which society as well as the individual can and should participate.

AIDS is a "relatively controllable process" in which the attitude of the subject and society are the key for combatting and preventing the possible development of the syndrome, and thus "give time" (a variable fundamental in the process) for science to find more efficient solutions than those that already exist.

Conclusion. AIDS as a process allows us to define the stages and aspects of the disease over which science already has knowledge and answers to those others that are still being investigated, which would permit public opinion to regain its confidence in scientific discourse.

E.766

THE DOUBLE CONTAGIOUSNESS PHENOMENON: FROM SEROPOSITIVITY TO PSYCHOPOSITIVITY.

Conde, F.; Coronado, A.*, Arredondo, C.*, Gil, E.*.
Ministery of Health.-Spain.

Objective. As can be seen from the analysis of the attitudes the population carried out by means of representative surveys, we are confronted by a dual "contagiousness", the most important from the point of view of the development of the disease, which must be fought by science and healthy education. But, on the other hand there also exists the "psycho-social-contagiousness" of fear, of irrational attitudes, that lead to segregation and social racism. Eliminating this phenomenon is fundamental to be able to cope with the disease and develop information campaigns (prevention) which upto now have been the only real means of fighting this problem.

Conclusion. The report develops the concept of "psychopositivity" (fear, rejection, isolation...) as one of the major sources of difficulties in the fight against AIDS. Psychopositivity creates "repression", which leads those affected to turn their backs on the health system, to hide themselves to avoid greater complication, to look for parallel solutions, to not take care of themselves, to abandon the system, all of which are negative for themselves as well as for society.

E.767

ACCEPTANCE AS A PRE-CONDITION FOR AIDS-PREVENTION AMONGST I.V. DRUG USERS

Dr. Ingo Michels, Deutsche AIDS-Hilfe e.V., Nestorstraße 8-9,
D - 1000 Berlin 31

There is at the moment no data for the prevalency of HIV that is accurate because the necessary scientific and social network is missing. Also there are no uniform standards for the determination of regional differences in respect of the first appearance of HIV, the methods of application of illegal drugs, different needle-sharing practices, varying levels of availibility of sterile needles and syringes and condoms, inexact information on the sexual behaviour of i.v.d.u. etc. The existing studies amongst groups in prisons, treatment centers and hospitals indicate an increased incidence which threatens to increase if the necessary preventive measures are not provided and carried out expediently. The Deutsche AIDS-Hilfe calls for the de-criminalisation of those affected, the development of low treshold treatment opportunities without therapy and abstinence demands, subsequent professional support with adequate financing, needle-exchange programs and distribution of condoms (also in prisons). Further no forced testing in the granting of places in drug rehabilitation, controlled substances with methadone for those i.v.d.u. at risk of infection along with those already HIV-infected or suffering from AIDS and the incorporation of a care-dimension for HIV-infected and AIDS-diagnosed d.u. into the existing therapy programs including a possible personal care until death. The Deutsche AIDS-Hilfe calls in answer to the often catastrophic state of health of i.v.d.u., estimated between 50.000 and 100.000 of which probably 30% are already infected. A call which must be followed by a sense of humanity which will defend against alienation and stigmatisation.

E.768

E.769

"EDUCATION ABOUT AIDS" COURSES, VICTORIA, AUSTRALIA

Goller, Ian*;Jones,J.**;Houvardis,S.* and Lewis,V.*

*Health Promotion Unit, Health Department Victoria, Melbourne, Victoria Australia,**Social Biology Resources Centre, Melbourne, Victoria, Australia,

Objective. To evaluate the impact and outcomes of a series of 6 day multidisciplinary AIDS education programs designed for health, welfare and educational professionals.

Methods. Various tools have been used to evaluate these courses. These include knowledge and attitudinal questionnaires as well as in depth interviews with selected course participants.

Results. In the period June 1985 to December 1988 16, 6 day "Education About AIDS" courses have been held in both country and metropolitan regions of Victoria. Over 540 people have completed these courses, the participants coming from a wide range of health, welfare, education and community groups. Knowledge about AIDS has been shown to improve significantly during the duration of the course (approximatley 6 weeks) and is maintained at these levels 3 months following completion. Participants report that they are more comfortable and confident in communicating with others on AIDS and issues of sex and sexuality. Course participants have shown skills in undertaking many AIDS initatives e.g. policy development, educational sessions and counselling within their institutional or employment groups. Participants show a positive attitudinal change in relation to many AIDS related issues. e.g. towards people infected with HIV and IV drug use issues.

Conclusions. These educational programs have been shown to have a major impact on AIDS awareness and prevention activities in the state of Victoria.

E.770

EN MATIERE DE PREVENTION

Haddad,Wadad World Health Organization
Regional Office for Europe/Copenhagen-Denmark
Paris. France

-Afin de pouvoir prendre une décision responsable et avertie, nous avons besoin:

. De connaissances sur le comportement sexuel sain qui implique des choix et des responsabilités.

.D'une éducation sexuelle efficace que est saine réaliste, pragmatique, non moraliste, éducation qui valide la sexualtié comme un aspect positif de la vie, qui réduit la peur, donne des informations claires et honnêtes et qui met l'accent sur les pratiques sûres d'être sexuel et offre des comportements alternatifs à considérer,

-Souligner, dans la transmission des messages efficaces pour les relations sexuelles saines, l'importance du langage utilisé, d'attitude réceptive, de qualifications interpersonnelles et de communication.

-Viser dans les programmes d'enseignement des pratiques sexuelles saines dans toute la communauté des différents groupes de la population, utiliser différents types d'information selon le groupe et préparer des solutions éducatives ou de précautions nécessaires afin de limiter le nombre de personnes infectées et de réduire les conséquences de l'infection.

E.771 PROBLEMS IN THE INTERFACE BETWEEN THE MEDICAL TREATING SYSTEM AND THE PATIENT/FAMILY SYSTEM

Patten, John
The Ackerman Institute for Family Therapy, New York, New York, USA

Many medical management problems occur in AIDS patients because of poor relationships between patient/family and the medical system (doctors, social workers, nurses, administrators, etc.). The Ackerman AIDS Project, by using psychotherapeutic and educational techniques with many individuals, couples, and families and members of the medical systems, has been able to show improvement in these relationships.

For instance, many individuals, families, and health care workers believe the equation AIDS=DEATH. This is in spite of AIDS being seen by the writers and by many members of the medical community as behaving more like a chronic illness. When patients' and families' percepts of AIDS has been psychotherapeutically shifted from FATAL to CHRONIC, they feel and act more hopeful, they are likely to be more compliant to treatment protocols and to take better care of themselves. Normal activities of living can be resumed once the illness is seen in a different perspective. Patients and families often feel empowered to ask more questions of the medical treating system and to be less passive about their illness.

To create a shift in perception, we must place emphasis on basic information and education about AIDS. Ignorance and misinformation abound, the stigma, anxiety, isolation, and guilt that surround AIDS make education about everything from testing to treatment essential. It is a time-consuming, repetitive process which requires a high degree of expertise.

E.772 PRIMARY HEALTH CARE FOR HIV-INFECTED PEOPLE

Kirschenbaum, David; Eigo, J. and Long, I. AIDS Coalition to Unleash Power, New York, New York, U.S.A.

Objective. To discuss the availability of primary care (baseline health care) for HIV-infected people.
Methods. We interviewed physicians, researchers and government officials and analyzed data on trial enrollment and epidemiology.
Results. Our research indicates that there is a two-tiered health care system in the U.S. Some patients with economic resources receive primary care consisting of regular medical visits, AZT and PCP prophylaxis. A second group, economically deprived, receives little or inadequate primary care. Participation in clinical trials is generally restricted to those who have received primary care. We will focus on the obstacles to obtaining treatment in New York City as a specific example.
Conclusion. The U.S. government should be meeting a standard of baseline health care for all HIV-infected people, consisting of regular medical visits, AZT and PCP prophylaxis. In addition, the government should rigorously enforce equitable access to trials.

E.773 INNOVATIONS IN AUSTRALIAN NURSING

Nugent, Joy.
Private Palliative Care Services Pty Ltd, Adelaide, South Australia, Australia.

This paper traces the growth of an Australian nursing innovation: a professional service to meet the needs of those suffering a life threatening illness. Private Palliative Care Services Pty Ltd (PPCS) was created to provide a health care option for individuals wishing to live in ways that are personally meaningful and significant. Professional nurses assessed by PPCS practice as private primary nurse practitioners in meeting the physical, intellectual, emotional and spiritual needs of patients. A key feature of their practice is third party reimbursement from a major private health insurer in the form of a Palliative Care Benefit. The development of the Company required considerable effort and expertise. Professional and political lobbying at a range of levels was necessary to ensure a legitimate place in the health care system along side well established public systems. On going education programs provide support for the palliative care nurses as well as necessary revenue to meet office expenses. Details of Company structure, cost effectiveness and the practicalities of establishing a private nurse practice are discussed. It is believed that the PPCS model of practice holds international potential and interest for nurses.

E.774 Culturally Sensitive Care at Minimal Cost Through In-House Health Attedant Care.

Moore, Teri, LPA,MPA,CST*, Madden, Constance**
*California State University, Hayward, California, USA,**San Francisco State University, San Francisco, California, USA

Objective: Providing optimal, culturally sensitive care at minimal cost to People of Color and others with AIDS and ARC.
Methods: Use of in-house, hand-picked and trained home health attendants within a system of comprehensive case management offers cost effective care in a setting whree quality care can be agency-insured. An interdisciplinary Team consisting of program directorr, nurse case manager, social worker, home health coordinator and attendants provides a higher morale and more continuity of care than case management where services are "farmed out." Data collection regarding time and costs can also be monitored more effectively when most services are in-house.
Conclusions: As care for AIDS clients becomes increasingly costly and draining, the in-house home health attendant model adds greatly to team spirit while cutting costs so that more clients may be helped. The HHA program, overseen by an interdisciplinary Team, is very effective in providing quality, culturally sensitive care to minority AIDS/ARC clients.
Results: More clients are seen; costs are minimized; morale is enhanced.

Table of Conferences:	Number of Participants:
1 People of Color Conference, Sacramento, CA	400
2 Life Foundation, Hawaii	450

E.775 PSYCHOSOCIAL SUPPORT SYSTEM FOR PEOPLE WITH HEAMOPHILIA AND HIV IN THE FEDERAL REPUBLIC OF GERMANY

Ian Schäfer, Norbert Specht, Deutsche AIDS-Hilfe e.V., Nestorstr. 8-9, 1000 Berlin 31, West-Germany

Objective: To develop new and practical educational councelling strategies and support systems for haemophiliacs in the FRG. Methods: In cooperation with the Haemophilia Society, Haemophilia Treatment Centers, Deutsche AIDS-Hilfe and haemophiliacs with HIV regular meetings were held to design a concept for support system. Results: Although 50 % of the estimated 6.000 haemophiliacs in West-Germany are HIV-antibody-positive the lack of a non-doctors controlled support system became evident. There is a need for self help groups to talk about social and sexual problems in an open private atmosphere without a doctor's guidance. Conclusion: The haemophiliac support system should be unlinked from medical treatment centers. The existing network of 80 local AIDS help groups in the Federal Republic can offer the limited number of haemophiliacs the infrastructure for non-therapeutical and therapeutical self-help groups. More data will be presented at the conference.

E.776 DISCRIMINATION OF MALE AND FEMALE PROSTITUTES UNDER THE ASPECTS OF AN INCREASING SOCIAL CONTROL IN THE CONTEXT OF AIDS.

Micaela Riepe, Deutsche AIDS-Hilfe e.V., Nestorstr. 8 - 9, 1000 Berlin 31, West-Germany.

Objective: In order to fight against prejudice prostitution must be presented as a normal profession and the health consciousness amongst prostitutes must be clearly shown.

Methods: The experiences of all organizations of Federal prostitutes are to be taken into consideration including the evaluaton of existing results on voluntary and compulsory HIV-tests as well as the numerical development of sexual transmitted diseases in the years 1985 to 1987.

Results: Prostitutes cannot be considered a relevant group for the transmission of HIV-infections and further sexual transmitted diseases. Male and female i.v. drug users who get their money for drugs by prostitution do have other living conditions.

Conclusion: A Precondition for the stabilization of the health status of prostitutes is the acceptance of prostitution as a profession on one hand and a continous information and education of the male population about the necessity of safer sex on the other hand.

E.777

LE SIDA, UN PROBLEME DE TOUS

Anabitarte, Héctor ; Mompradé, B.
Comité Ciudadano Anti-SIDA de Madrid SPAIN

Objectif. Définir les stratégies des organizations non-gouvernementales et des mouvements sociaux, face à l'information et prévention du SIDA.
Méthodes. Les experiences derivées des activitées quotidiennes du Comité Anti-SIDA de Madrid, à travers les programmes d'information, des conféréncea, des colloques, des soins directs avec les porteurs, malades et sujets que leur comportement rend vulnerables à l'infection à VIH.
Résultats. Compte tenu de l'experience acquise après cinq ans d'existence, on a constaté la pris de conscience de la population, les changements d'habits, des soins sanitaires plus attentives; mais encore on peut resaigner des situations de discrimination et réfus à légard de personnes infectées par le VIH ou soupçonnées de l'être.
Conclusions. Les mouvements sociaux contre le SIDA en Espagne ont joué un rôle très important pour éviter la progression du virus et pour assumer cette maladie comme une simple maladie, sans aucune autre contenue.

E.778

MODEL PROGRAM: COLLABORATION OF PRIVATE AND PUBLIC HEALTH SYSTEMS ON OUTPATIENT SERVICES

Latterman, Nadine M.*; Rosenthal Susan**, Rotenberg, Ellen**, Ernst, Jerome M.D.*, *Bronx-Lebanon Hospital Center, **New York City Department of Health.

Objective. To link two (2) separate health systems centered around AIDS care in the South Bronx.
Methods. The majority of AIDS patients served by Bronx-Lebanon Hospital Center are primarily IVDA's and homeless. The hospital has established an active outpatient center to manage these patients after hospital discharge. The Department of Health New York City has begun an active anonymous counseling and testing program for self-referred clients. A testing center has been established in the same building as the hospital's AIDS clinic. With the opening of this center talks were begun between the Commissioner of Helath's staff and hospitals AIDS Team with the goal of preventing duplication of services and thereby, identify gaps in services and the development of needed services.
Results. Close collaboration with Health Department clients who test positive are immediately seen at the hospital's AIDS Clinic for followup medical care. Clinic patients, referred from hospital outpatient centers are referred to City Site for HIV testing and counseling. This program has functioned over six months. Approximately 100 city referred clinics patients have been seen in the hospital clinic and 50% have been found to have reduced immunity.
Conclusion. Close collation between private and public sector is working in this instance in the South Bronx.

E.779

AIDS PATIENTS AND THE USE OF EXPERIMENTAL HIV DRUG THERAPIES OBTAINED OUTSIDE OF CANADA

Jackson, Lois*and Fanning M.*
Toronto General Hospital, Toronto, Canada

Objective: To examine the relationship between patients' involvement with AIDS community organizations and the use of experimental drug therapies obtained outside of the country.
Method: Semi-structured interviews were carried out with 25 AIDS patients in three major centers in the province of Ontario.
Results: Of the 25 AIDS patients interviewed, 7 are(or have been) involved with obtaining experimental HIV drug therapies from outside of Canada. All 7 patients are gay men but only 4 are (or were) actively involved with AIDS community organizations, and 3 are knowledgeable of the activities of such organizations although they are not actively involved. 6 of the 7 patients indicated that their physicians recommended seeking drug therapies from outside of the country. Seven of the 25 patients interviewed are gay men who are actively involved with AIDS community organizations. Of these only 4 have obtained drug therapies from outside of the country. Two have chosen to be "drug free" against the strong recommendations of their physicians.
Conclusions: There is no necessary relationship between patients' active involvement with AIDS community organizations and obtaining experimental HIV drug therapies from outside of Canada. Preliminary research indicates that a combination of factors including knowledge of AIDS community organizations' activities and physicians' recommendations play a role in determining patients' involvement with such drug therapies.

E.780

THE STOCKHOLM MODEL- INFORMATION STRATEGIES AND CAMPAINS TO SUPPORT THE COMMUNITY INTERVENTION WORK.

Asp, Anna-Karin, Stockholm County Council Aids Prevention Project

Objectives: To let the information unit within an aids prevention project support, facilitate and quicken the work with community intervention. A close collaboration between information service and aids prevention work.

Method: To put an information unit with educated people within a health education project and work close together. The information unit supports the people in the project who work with our four main target groups: young people, health and medical staff, immigrants/refugees and homo- and bisexual men. The information unit keeps the project going by giving service through our information centre to all the 5.000 people that we have educated within the project. We provide them with brochures, videos, books, exhibitions. We run seminars to keep their interest on top. We produce a paper "Insight". We formulate the messages and advertise in newspapers, local papers and we organize public activities.

Results: To let an information unit work directly within a project makes the projecté message more clear and makes the needs of information strategies more clear. The project can very quick get an answer on what is possible to do regarding to information strategy. It also facilites and quickens the long-term work with community intervention work. We have within one and a half year reached 5.000 people which we now provide with all kind of information at our information centre.

E.781

PROGRAMME OF ASSISTANCE TO RELATIVES OF PATIENTS CARRIERS OF HIV

Lima, M.P.S.; Ferreira, R.P.; Mielle, A; Rocha, M.D.C; Tanibata, P.R. - Hospital e Maternidade Celso Pierro da Pontifícia Universidade Católica de Campinas-S.P.-Brasil.

OBJECTIVE: This work consists of a programme of multidisciplinary assistance to relatives of patients carriers of HIV in the Infectious Disease service of HMCP-PUCCAMP.

METHOD: Meeting of groups of relatives with multidisciplinary team that takes part: physicians, nurses, psychologists and religious, aiming to give support and technical and psychosocial explanations.

RESULTS: 1. For the professional team, the confrontation with relatives divided responsabilities and alleviated the anxiety that the problematical AIDS includes. 2. We succeeded refit the patient to the familiar environment, extending the acceptation initially found in the multidisciplinary team. 3. We observed wide interest of the relatives in discussing and assimilating the AIDS question.

CONCLUSION: This meeting results in gains for the relatives, patients and principally for the multidisciplinary team. We think, therefore, that such event could extend to the community in general (Public Health Centers and District Entities).

E.782

Pioneer Prototype, Organizational and the New Shanti

Sandoval, Chris , Shanti Project California, U.S.A.

OBJECTIVE: How to empower human beings with the optimum measure of life while facing life-threatening extinction through AIDS.
METHODS: Shanti Project grew out of the Apollo II mission which put the first man on the moon. In Apollo II individuals worked at peak performance to exceed all notion of human expectation. Both Apollo II and Shanti Project evolved experientially without a prototype. At Shanti the experience of AIDS became the teacher while the caregiver and the cared became the pupils.
CONCLUSIONS: What people learned experientially in their quest to go into outer space gave permission to those same people to go into the inner space of human feelings which peaks in the final stage of human maturation, prior to life transition.
RESULTS: Civilization and its institutions attempt to limit the expression of human emotion with the institutions of family, faith and community. In the final analysis it is human emotion which allows People with AIDS to face the maturation of their lives.

E.783

THE SOCIAL AND ECONOMIC IMPACT OF HIV ON CANADIANS WITH HEMOPHILIA

Mindell, William; O'Neill, R. and French, S.
Canadian Hemophilia Society, Montreal, Quebec, Canada

Objective. To study the social and economic impact of HIV on families with hemophilia in Canada based on a selected set of self-reported parameters.
Methods. A mail survey was conducted on an estimated 10% systematic sample of hemophilia families across Canada.
Results. From a sample of 250 eligible households, 134 questionnaires were returned for a response rate of 54%. Respondents included hemophiliacs, spouses or parents of hemophiliacs. In 74% of the respondent families, the hemophiliac had been tested for HIV antibody and 65% of the respondents knew the test results; 57% of those who knew were HIV+. Thirty percent of HIV+s have experienced HIV-related symptoms. HIV+s had a higher rate of unemployment (33% vs. 5%), a lower average annual income ($17,600 vs. $27,700), a higher rate of separation and divorce (11% vs. 0) and described more stress and other difficulties at work and school. Forty-five percent of all respondents felt they had been refused employment or lost job opportunities because of health-related reasons; 65% were HIV+ and 35% were HIV-. HIV-s had experienced normal work-related increases in income in recent years, while 24% of HIV+s had experienced decreases in household income including the impact on caregiving parents and spouses.
Conclusion. HIV+ hemophilia families have already experienced significant stress, and social and economic repercussions. Hemophiliacs, regardless of their HIV serostatus, feel they are experiencing workplace discrimination as a result of the association of HIV with the hemophilia community.

E.784

LENTIVIRUS INFECTION GIVES RISE TO LENTI-UNDERSTANDING AND THUS TO A 10 YEARS' INCUBATION PERIOD FOR ERRORS IN AIDS POLITICS

MICHAEL G. KOCH

Vårdcentralen, S-546 00 Karlsborg, Sweden

Due to a treacherous gap between what is visible and what is the case in the course of a lentivirus epidemic, society reacts on the situation to that degree as it is obvious in terms of AIDS cases, i. e., a 10-year old situation. The real state of epidemic spread, however, is to be measured by the number and distribution of HIV carriers, mainly hidden for immediate surveillance. Thus certain mistakes are likely to be made and common errors to be withheld for about 10 years, until their consequences are difficult to ignore. We do not perceive continuously growing changes unless their speed exceeds certain threshholds. In the same manner as HIV slips in under the threshhold of our immune system by its "lenti"-qualities, this lentivirus epidemic does not evoke adequate reactions in health politics until late in its course. Bavaria is today rather isolated in health politics. Is that a good measure for truth? Bavarian health politics (vaccination, X-ray screening, teaching venerology) in the good tradition of Max von Pettenkofer and other famous scientists, have in historical time often been criticized by most or all other countries. After 7-20 years the world regularly has followed Bavaria's example, sharing the underlying considerations. Will this happen again in the time of AIDS?

AIDS KNOWLEDGE, ATTITUDES, AND RISK REDUCTION PRACTICES AMONG YOUNG ADULTS IN TWO BRAZILIAN CITIES.

Janowitz, Barbara*, Bastos, V.**, Rodrigues, S.R.**, Vacarelli, J.***, Nakamura, M.***, and Morris, L.****
*Family Health International, Research Triangle Park, North Carolina.
**Federal University of Bahia, Bahia, Brazil; ***Centro Materno-Infantil, Sao Paulo, Brazil; ****Centers for Disease Control, Atlanta, Georgia.

Objective: To compare the knowledge, attitudes and risk reduction strategies concerning AIDS of Brazilian youth in two urban areas, one of which is the center of the AIDS epidemic and the other of which has fewer reported cases and also reflects conditions at an earlier time period.
Methods: Population-based surveys of young adults aged 15-24 have been carried out in Sao Paulo and Salvador, Brazil. These surveys provide information on what they know about AIDS, how they assess risk for various groups and for themselves, and steps taken to reduce risk.
Results: Results from the Salvador survey show that while young adults know about AIDS, and while they consider others to be at high risk, they consider their own risk to be low. While 70% of single sexually active men reported that they had taken action to reduce risk (mostly condom use), only 27% reported that they used condoms du ring their last sexual intercourse (38% for those who reported that they took action). One quarter of the men reported more than one partner in the previous month and condom use was higher for those with one than with more than one partner.

These results will be compared with those from the more recently carried out survey in San Paulo, Brazil.

E.787

AIDS KAP SURVEY IN METROPOLITAN LIMA-PERU

Luján, Manuel#; Li, Dina##; Foreit, James###; Payne, Alice####.
#Peruvian Health Ministry, Lima, Perú, ##Proyecto SIDA, Lima, Perú, ###Population Council, Lima, Perú, ####The Johns Hopkins University/Population Communication Services, Baltimore, Maryland, USA.

Objective. To provide baseline information for the design and, ultimately, the evaluation of a mass media education campaign.
Methods. A structured questionnaire was applied to 1922 men and women aged 15-44 included in a multistage stratified sample of the low and lower middle class population of the city of Lima.
Results. 97% of the people interviewed have heard about AIDS, and 91% knows AIDS is present in Perú. Most people can correctly cite the main routes of transmission, however, incorrect knowledge about how AIDS is not transmitted is prevalent (66% and 60%, respectively, believe saliva and the use of public toilets can spread AIDS).
A low proportion believes to be personally at risk of acquiring AIDS (28%); 13% admitted to having multiple sexual partners in the last six months, 36% have used a condom at least once and 7% had used it in the last month.
Most interviewees had obtained their AIDS information from the press. 98% thinks the total population should receive information about AIDS via radio and television. Furthermore, a very high proportion thinks a mass media campaign should promote the use of condoms in adults and young people, and 53% extends that to children.
Conclusions. Along with a high level of knowledge, myths and misconceptions about AIDS persist. The population, however, is well predisposed to mass educational activities. Despite the low use of condoms no major prejudices seem to be present for their promotion as a preventative aid.

HOW TO DEFEND RIGHTS IN WORKPLACE: PROBLEMS AND INSTRUMENTS IN ITALY

Tarocchi, Angiolo*; Agnoletto, V.*; Citterio, R.*; Capeoni, F.*; Frigerio, L.* and Tradati, C.*
*L.I.L.A.(Lega Italiana per la Lotta contro l'AIDS), Milan, Italy

Objective. To delineate problems and instruments to defend rights connected to HIV-infection on workplace in Italy.
Methods. Problems and instruments have been evaluated on the grounds of known discriminations on workplace, consultations with workers and trade-unionists, analysis of Italian laws and regulations in force and declaration WHO/ILO (Press Release WHO/24 5.7.88).
Results. A guide-platform has been elaborated. The arguments treated were: rights to work and to anonimity, inutility of HIV/AIDS screenings, overcoming of delay period, health and security on workplace, negotiation of working conditions and organization. Work and health institutions (information, prevention, assistance, etc.), social security. For this last argument a need of quicker bureaucracy has been underlined. The extension to claim-AIDS illness of the benefits provided for tuberculosis (Italian laws No. 1088/14.12.70 and No. 88/4.3.87, has been proposed.
Conclusions. Italian legislation contents instruments to face HIV-related problems on workplace and, if correctly enforced, to defend rights. Nevertheless, some adjustments regarding claim-AIDS illness will be necessary.

E.791

AIDSSAFE: AIDS PREVENTION TRAINING FOR FUNCTIONALLY IMPAIRED ADULTS

A. Houston-Hamilton,* N. Day,* P. Purnell* (*Polaris R &D, San Francisco)

Objective: To describe an effective AIDS prevention program for psychiatrically impaired and developmentally disabled populations
Methods: Patients at St. Elizabeth's Hospital in Washington, D.C participated in 90 minute group training sessions in groups of 10-15. A short video was developed especially for the target populations. Using a cartoon format to avoid overstimulation, the video discussed HIV dissemination via intravenous drug use and sexual contact in explicit terms and described methods for preventing exposure. The video depicted people of all ages, races, body types, and social classes and was followed by a question and answer period. Participants were then required to demonstrate understanding by using non-verbal methods to answer questions on the presentation and to verbally correct misunderstandings on the part of their peers. Sessions concluded with participants completing personal risk assessments based on drug and sexual behaviors in conjunction with the hospital's medical and counseling staff
Results: Over 1300 psychiatric outpatients with a wide range of diagnoses were trained. Comprehension of key points was demonstrated by over 90% of all patients who were not heavily medicated during training sessions. Use of the training program with developmentally disabled, functionally impaired and low literacy populations demonstrated similar results.
Conclusion: AIDS prevention education can be successfully undertaken with a variety of functionally impaired people.

E.792

EVALUATION OF DIFFERENT PREVENTIVE MEASURES

Heckmann, Wolfgang; et al. Sozialpädagogisches Institut Berlin, FRG

Objective: To present first results of different programs to prevent AIDS/HIV in the FRG: outreach work in the gay community and among prostitutes, support system for HIV-exposed children and their families, women-oriented HIV-prevention.
Methods: Evaluation took place by semi-structured interviews, questionnaires and protocol methods.
Results: 1. communicative strategies are potent for HIV-prevention among special target groups,
2. the health care system is - combined with the innovative potential of a special program - able to support children-at-risk,
3. a special program focussed on women's problems with HIV/AIDS can be helpful.
Conclusion: The "model programs", developed by the Federal Minister of Youth, Family, Women and Health are effective and prove the evidence of the psycho-social approach to AIDS prevention.

E.793

AIDS EDUCATION: A COMMUNITY DEVELOPMENT APPROACH

de Negri, Bérengère; Graybill, D. The Institute for Training & Development, Amherst, Mass. USA.

Objective: To present a global AIDS education and training strategy based on community development principles.
Methods: Presenters will outline a comprehensive model for AIDS prevention which: (a) is based upon Primary Health Care (PHC) philosophy and strategy; (b) builds upon existing formal and informal community structures, and (c) emphasizes communication, education and counseling procedures for reaching people directly and within the context of their own cultural traditions.
Results: Based on examples discussed in this paper a prerequisite for ensuring the success of AIDS education is a training program for national, regional, and local AIDS educators in how to plan, implement and evaluate AIDS education campaigns that are culturally appropriate, cost-effective, participatory and community-oriented.
Conclusions: AIDS intervention strategies must start with the support and commitment of the national leadership and then gain the support of local leaders for AIDS education. A participatory community development approach which incorporates nonformal education, the organizing of local community groups and experiential training methodologies are best suited to the implementation of effective AIDS education.

E.794

ADOLESCENTS AND AIDS.

R. Maul Swansea, United Kingdom

Objective: To assess the knowledge, attitudes and beliefs of 14-15 year old secondary schoolchildren, concerning AIDS.

Methods: Questionnaire survey - this involved administering pre-coded, self report questionnaires (completely anonymous and confidential) to a sample of 490 secondary school pupils. The data was analysed with SPSS software.
Results: Knowledge about AIDS among 14-15 year old schoolchildren.

AIDS is a fatal disease	94%
Caused by a virus	86%
Person could be infected and not have signs of AIDS	92%
Use of condom lowers the risk of AIDS	97%
AIDS infection spreads through:	
- sharing needles	98%
- infected blood transfusion	98%
- casual sex	93%

Conclusion: Despite sound knowledge about AIDS, 49% expressed much fear of AIDS and 44% expressed moderate fear. 21% to 28% expressed prejudice. 48% admitted there is strong to moderate pressure to have sex. We recommend that:
1. The attention of the media is focused on the modification of attitudes and behaviour.
2. School health education programmes with emphasis on sex, sexuality and sexually transmitted diseases be developed and implemented.

3. Such programmes are aimed at 12 to 13 age group.

E.795

DEVELOPING A SEXUALITY FRAMEWORK FOR YOUTH
FLUX. A.. FLUX Ray ABSTRACT 7695

'State of Flux' Partnership, Northwood Middlesex UK

Objective: At present, sexuality education which leads to safer behaviour is one major aspect of the defense of individuals and societies against HIV infection and AIDS. Education itself creates enormous potential for value conflict between different groups in society. This programme develops processes and materials which are 'values-sensitive' and lead to positive engagement between groups where conflict may occur.
Method: This is a programme of Action Research which has taken place in Melbourne Australia and Hillingdon Borough UK. It has resulted in two educational resource packs being designed, trialed, introduced and evaluated. Our research in schools and health care management has shown that peer education is a powerful medium for learning where individual choices are at issue and socially sensitive behaviours are sought. Educational materials emphasise information for making healthy choices and skills to enact those choices.
Results: A three-part research project in this area will be described with examples taken from 'Working Around AIDS Together' and the field trial evaluations.
Conclusion: Sexuality Education in British schools presents a major opportunity to retard the spread of HIV infection. Local boards of Governors Parents and Teachers require support, approaches and materials to sensitise their educational approach to the community they serve.

TITLE: VIDEO PEER AIDS EDUCATION IN INCARCERATED ADOLESCENTS

AUTHORS: *Roseman, J., *Baker, C.J., *Firpo, R., * Huscroft, S., *Re, O., *Morris, R.
*Juvenile Court Health Services, Los Angeles County, California, USA

OBJECTIVE: To test the concept of peer education for AIDS high risk behavior among adolescents incarcerated within the Juvenile Halls, County of Los Angeles.

METHODS: Four videos were produced by the minors with their active participation in the film-making process as well.

RESULTS: Participation was enthusiastic and motivation was high. The level of knowledge acquired was substantial and sharing of information was adequate for all parameters: Involvement, awareness, dealing with facts and villingness to discuss feelings.

CONCLUSION: The concept of peer education proved to be particularly applicable to incarcerated juveniles as they tend to be alienated from their captors. The videos were an effective tool in education towards minimizing/preventing high risk behavior for AIDS.

"LE SIDA AU SENEGAL: DOCUMENTS AUDIOVISUELS"
BA O. CHU DAKAR SENEGAL
D'ALMEIDA L. "PLURALE" BP.5356 DAKAR-SENEGAL

OBJECTIFS Il s'agit de: mieux informer le grand publique, sur les modalités de prévention du SIDA; contribuer à une prise de conscience du grand public sur le péril que fait courir le SIDA et sur les responsabilités individuelles et collectives.
METHODES:

Le prétest à la réalisation des documents audiovisuels: réalisation d'une première série de documents puis évaluation sur la base d'un questionnaire auprès de 100 jeunes, 100 professionnels et 100 individus, pour aprécier et mesurer leur niveau d'information et leurs attitudes à la participation. Toute projection de ces documents est suivie de discussions.
RESULTATS:
Réalisation des documents audiovisuels, discussion et analyse des attitudes envisagées par bénéficiaires.

CONCLUSIONS:
Ces documents audiovisuels se conçoivent comme une participation à l'équité sociale: nul ne peut être exclu esd problèmes que pose le SIDA.

E.799

"ROULETTE"-EDUCATIONAL VIDEO ON AIDS
Gerbase,Antonio Carlos;Ferreira,J.;Tomasi,L.;Gerbase,C.
Secretaria da Saúde e do Meio Ambiente do Rio Grande do Sul, BRASIL.

The video presents four paralel stories that exemplify typical situations observed in the brazilian AIDS context. It features the lives of Ferando,a thirty-seven years old,high class homossexual man with multiple partners;Teodoro,a twenty-nine years old,middle class,bissexual man,married,father of one child;Carol,a seventeen year old middle class,drug addict girl; and the members of the AIDS control staff.

The multiple aspects of the problem,the relative risk of transmition,the risk behaviors and the ways to prevent the infection are shown and discussed in a clear and objective language.

The eduactional objectives of the video,wich is part of a kit including also posters,folders,slides ans tapes,is:

1)To reduce the populational neurosis on AIDS.

2)To give usefull information in order to try to change risk behaviors.

3)To motivate health teams to discuss the subject.

DURATION : 45 minutes.

VIDEO FILM SCREENING — OLGA'S STORY
Ashery, Rebecca S.
National Institute on Drug Abuse, Rockville, Maryland USA

The National Institute on Drug Abuse announces the availability of a video produced by the Latino Consortium/KCET in Los Angeles through a NIDA grant with the Georgetown University Child Development Center. Olga's Story is an interview tih a woman who has AIDS. She talks about her youngest child who also has AIDS and her will to live because of her children. She describes how she got the disease and the rejection by her family and begs whose who use drugs to stop. The videotape is produced in Spanish, however, a "dubbed" English version is available. The tape is 20 minutes long. Drug counselors and health professionals can use the videotape to educate Hispanic women and men who are at risk for AIDS because they are sexual partners of intravenous drug abusers or are drug abusers themselves. The videotape comes with a leader's guide and can be used as a "trigger" film to stimulate discussion about AIDS. The videotape is for adult audiences and is not appropriate for school prevention programs.

E.801

VIDEO FILM SCREENING — ALICIA
Ashery, Rebecca S.
National Institute on Drug Abuse, Rockville, Maryland USA

The National Institute on Drug Abuse announces the availability of a video produced by the Latino Consortium/KCET in Los Angeles through a NIDA grant with the Georgetown University Child Development Center. Alicia is a dramatic portrayal of a woman who learns that she and her child test positive for the human immunodeficiency virus (HIV). In an emotional scene she confronts her husband about his drug using behavior which caused the HIV infection. The meaning of HIV, AIDS, and modes of transmission are described in a clear, concise manner. The videotape is produced in Spanish. Drug counselors and health professionals can use the videotape to educate Hispanic women and men who are at risk for AIDS because they are sexual partners of intravenous drug abusers or are drug abusers themselves. The videotape comes with a leader's guide and can be used as a "trigger" film to stimulate discussion about AIDS. The videotape is for adult audiences and is not appropriate for school prevention programs. The videotape is 20 minutes long.

POTENTIAL RISKS OF ULTRAVIOLET RADIATION (UVR) IN HIV INFECTION.
FLEGG Peter J, I.D.U., Monsall Hospital, MANCHESTER. U.K.

OBJECTIVE: To determine the differences in recreational UVR exposure and the knowledge of its effects in HIV seropositives and in those not at risk of HIV in the light of reports that both UVA/UVB radiation are immunosuppressive and that UVR can activate HIV expression.
METHODS: Questionnaires were answered by 58 male homosexuals seropositive for HIV (11 with AIDS or ARC) and 61 controls matched for gender but not from an at risk category for HIV infection. Skin type was assessed from reported response to UVR.
RESULTS: Skin type and mean age did not differ between groups (HIV positives. 26.4 years, controls 24.8 years). HIV positives had significantly greater regular sunbed or solaria exposure than controls (20.7% vs 6.5%, $p<0.05$) and greater exposure to natural sunlight sufficient to tan or burn the skin over a 4 year period (11.5 weeks vs 9.5 weeks, $p = 0.06$). Knowledge of and attitudes to the harmful effects of UVR was similarly poor in both groups ("general health improved": 64% vs 57%; "immunity improved": 21% vs 23%). Only 60% of HIV positives and 53% controls thought UVR exposure could cause skin cancer. 65% of HIV positive also thought UVR exposure could improve the outcome of their HIV infection.
CONCLUSION: Knowledge of the harmful (photocarcinogenic and immunosuppressive) effects of UVR is poor. Greater exposure among HIV positives may partly be due to misconceptions that it might improve health and the outcome of HIV infection. HIV positives should be warned to reduce unnecessary UVR exposure in view of the theoretical risks involved.

E.803

INFORMATION, PREVENTION, EDUCATION: ETABLIR UNE THEORIE PREALABLE A L'ETABLISSEMENT DES STRATEGIES DE SANTE PUBLIQUE
Frédéric Edelmann*, JF Mettetal**
*ARCAT-SIDA, CNRS **Hôpital Necker, Paris, France

Objectif: affiner et renforcer les actions et les publications des organisations non gouvernementales.
Méthode: informatisation détaillée des demandes, analyse permanente des données, sondages, interviews.
Résultats: L'analyse de la situation française de 1985 à 1988 révèle assez facilement:
une absence de volonté politique, de moyens et de continuité dans la prévention du SIDA; un système palliatif fondé sur la publicité, sans évaluation préalable, ni évaluation publiée des résultats; une confusion générale entres les contenus des termes information, prévention, publicité, formation, et éducation.
Une évaluation régulière des demandes formulées et des besoins non formulés a conduit à élaborer une stratégie qui distingue clairement d'une part l'information, donnée, ou distribuée selon une hiérarchie verticale (médecin/patient, parents/enfants, professeurs/élèves, journaux/lecteurs, etc.), et d'autre part la prévention, c.à.d. un ensemble de savoirs, de techniques, de comportements, partagés par des individus en situation d'égalité théorique: couples, classes scolaires, membres d'association, groupes sociaux, etc. Dans ce cadre, la formation et l'éducation relèvent du domaine générique de l'information, même si l'éducation peut utiliser des techniques pédagogiques fondées sur l'échange.
Les tentatives de faire passer simultanément des informations, qui contiennent une charge émotive liée à la mort, et des messages de prévention liés à la gestion du plaisir et à la vie, rencontrent de fortes résistances. Elles ralentissent à la fois le passage de l'information, et l'acceptation de comportements de prévention, que la réduction des "campagnes de prévention" à la publicité pour les préservatifs ne favorise pas non plus. La prise en compte de ces difficultés a permis à l'ARCAT-SIDA d'affiner son action. Les demandes se sont depuis précisées, et l'efficacité des documents ou des interventions apparaît renforcée.
Conclusion: la clarification des notions d'information et de prévention semble, en France, être un préalable à toute campagne nationale ou ciblée

E.805

EDUCATION, INFORMATION, COMMUNICATION

MARY F. OWOR C/O UNICEF UGANDA, P.O. BOX 7047, KAMPALA.

BACKGROUND

AIDS was identified in Uganda in 1982. The National AIDS Control Programme was formed in 1986. In May 1988 the National School Health Education Programme, Ministry of Education, launched a Primary Science Syllabus with UNICEF assistance with AIDS as one of its topics under STD. This syllabus was designed by an Interministerial Panel formed in 1985. Awareness in Secondary Schools was organised because of the great threat of AIDS to young people in Uganda. Doctors and Educators were identified and trained in each District. From March 1988 the trained teams have been going around schools educating children and the community about AIDS.

METHOD

For each session a talk, illustrated with visual aids is given on History, Statistics, Modes of transmission, Social-economic implications, Myths and misconceptions, Available tests and Prevention of AIDS, followed by a question/answer discussion period.

IMPACT AND CONCLUSSION

By face-to-face interaction the teams are able to communicate information that the students had not received through other channels and correct misconceptions. It seems that there is a real break through in the fact that many students and the community feel free to discuss sensitive sexual issues openly. Communication between children and parents in the area of sex education thus seems quite improved. By March 1989 the Programme will have been introduced in all 34 Districts comprising of 7000 Primary and 800 Secondary Schools. Over 1,000,000 people have been made aware. The School AIDS Education Programme is being very well received throughout the country.

E.806

KNOWLEDGE,PERCEPTIONS AND ATTITUDES CONCERNING AIDS AMONG UNIVERSITY STUDENTS:PROPOSISTIONS FOR AN EDUCATIONAL PROGRAM.
Vermelho,Letícia L. *;Simões Barbosa,Regina M.*;Peres,Maurício A.*;
Sarantakos,Georgina*.
*UNIVERSITY HOSPITAL,FEDERAL UNIVERSITY OF RIO DE JANEIRO.

OBJECTIVE: To provide information for health educational programs based on real status of knowledge,perception and behavior related to AIDS among university students.
METHODS: Four hundred students of the Rio de Janeiro Federal University were interviewed and answered 41 questions each one.To analyse the results,simple proportions and higher correlations were infered from these questions with stronger associations.Finally,the epidemiological and psychosocial profile were defined and reported.
RESULTS:The disease etiology,main mechanisms of transmission and prevention were correctly answered by 75% of all students.There was,however,a significant increase of undecided and uninformed answers about the transmission by mosquitoes,saliva,cutlery,cups,water closet and others.Women's transmission is supposed to be associated with lesbianism.Information about the teatment and vaccine are poorly known.Finally,a strong prejudice correlated to homosexualism was observed.
CONCLUSION:Despite university students have a high level of information about AIDS from TV,newspaper,books,scientific reviews and others,the perception of the problem is distorted by prejudice and fear.Being AIDS a disease related to sexuality and death,subjects very difficult to deal with in terms of changing habits and behaviors,new Educational Programs should use new methodology based on these issues.

E.807

ADOPTION OF CHILDREN BORN TO HIV POSITIVE WOMEN

CORLETT Sandy*, K Skinner*, G O'Hara*, S Fowler*, J Mok**.
*Lothian Regional Council Social Work Department, Edinburgh
** Lothian Health Board, Edinburgh

Objective: To describe the placement in adoptive families of children born to HIV positive women.
Methods: Adoptive families were recruited from 2 sources 1) Foster families already caring for a child. All foster parents are informed and prepared to care for a child at risk of HIV, and some volunteered. Their strength of feeling for the child led these families to want to adopt. 2) Adoptive families specifically recruited for children at risk of HIV. All prospective adopters are informed about HIV, and told about children with special needs, including children at risk of HIV. Some families responded.
Results: 4 children have been adopted. All are now HIV negative with good health. Extensive preparation and support after placement includes medical advice, special support group, hygiene advice, practical help, financial subsidy. Issues are: dealing with the uncertainty of caring for a child who may become ill and die; confidentiality; what to tell the child.
Conclusion: Adoptive families have been found without special advertising from foster parents and prospective adopters. Informing all carers about HIV is crucial. Our experiences have informed development of an HIV screening policy for women placing children. Consideration of relatives as adopters of children whose parents die is a future issue.

E.808

SUPPORTED ACCOMMODATION FOR PEOPLE WITH H.I.V. RELATED ILLNESSES OR A.I.D.S. (S.A.T.A.)

Jane McArthur - K. Haughton and P. Davies - Lothian Region Council Social Work Department, Edinburgh.

Objectives
To outline our experience of developing a range of supported accommodation resources within the community.

Methods
Through the use of small Regional and Housing Association properties using a specially negotiated contract between ourselves and the Association. We aim to provide dispersed housing, with support which meets the needs of people with H.I.V./A.I.D.S. Most tenancies to date have been shared by two persons, with single rooms. All are furnished to a high standard. A gay couple able to provide lodgings for someone with H.I.V. have also been assessed and accepted on to our scheme. This development was achieved through advertising. Otherwise, contacts and negotiations have taken place with individual housing associations and housing providers. Contact with housing agencies has had two aims. Firstly, to achieve an element of positive discrimination for people with H.I.V./A.I.D.S. through direct tenancies involving a support agreement and secondly, to raise the issue of H.I.V./A.I.D.S. for housing agencies and promote good practice.

Results
Since October 1987, we have developed 10 such tenancies, and are offering support to 18 people altogether. We are in the process of negotiating further single tenancies and supported accommodation for single parents and their children. We are working in the main with current or ex-I.V. drug users, but in one instance, have a mix of ex-drug user and gay men. The support available is on a visiting basis, and centres on the practical and emotional means by which people with A.I.D.S. can remain in the community.

E.809

A COMMUNITY PROGRAM OF COMPREHENSIVE CARE FOR HIV DISEASE

Payne.F.*;Poretz.D.**;Sharrett.Carol*;Stage.T.***; Goldenberg.R.**;Morrison.A.**,*Fairfax County Health. Dept., Fairfax.Virginia. U.S.A.,**Fairfax Hospital.Fairfax.Virginia.U.S.A.,
***Community Services Board.Fairfax.Virginia.U.S.A.

Objective: To establish an interdisciplinary community based program for staging and case managing HIV infections which will prolong lives and slow the spread of HIV in the community.
Methods: The Fairfax County human services agencies, i.e., Health, Services Board, and Social Services have developed a voluntary program to provide education, continuing medical care, and psycho-social support to asymptomatic individuals infected with HIV. Patient sources are from the County's case finding activities, the substance abuse programs, private medical practitioners and hospitals. This program is linked to Fairfax Hospital's HIV Center to provide the broader range of care required for HIV case management. The program is 2 tiered: tier 1 consists of the County's interagency case management program (CMP) with primarily CDC Groups II and III. CMP provides every 6 months a social service, mental health, and medical evaluation including HIV p24 antigen and $\beta 2$ microglobulin assay. As the disease progresses to CDC Group IV, medical care responsibility shifts to tier 2, the Hospital's HIV Center which also serves the larger medical community.
Results: To date more than 300 cases mostly CDC Group IV have been followed by the medical staff of the Hospital's HIV Center. More than 30 cases have entered CMP during the first 18 months of operation.
Conclusion: We recommend that communities faced with serious drug abuse and/or STD problems consider similar programs.

E.810

The development of community-based AIDS initiatives

ROBIN GORNA, D. CAMPBELL, M. EEDE, D. HARRIS and M. HAZELL. The Terrence Higgins Trust (THT), London. England.

Objective To maintain a strong community base whilst developing, and professionalising the work of non-governmental organisations (NGO's) in responding to the AIDS crisis.
Method THT is the first UK, and the largest European, NGO concerned solely with HIV and AIDS. Services are provided by members of the community for one another. Since 1982, when THT was founded, increasing numbers of community based initatives are developing in the UK to access their own community groups.
Results The most effective health education occurs when community groups provide their own education - this is appropriate to the groups' existing behaviour, acknowledge obstacles to change and presents risk reduction as a positive alternative. This work is based in communities defined by area, institutional groupings or, more commonly, shared characteristics (eg sexuality, gender, age, use of drugs, ethnic groupings). Support services tend to be organised according to the person's medical diagnosis, or relationship to the diagnosed person (eg Buddies for people with ARC/AIDS, HIV+ve support groups, lover's support groups, family support networks). As community based organisations develop in numbers of clients, staff and volunteers, the services (education and support) must be increasingly professional, but not become distanced or lose their community base. These must complement statutory services rather than replace them.
Conclusion Community based organisations work on a level with people and by sharing skills and resources with statutory services we can avoid duplication and use our abilities more fully for a comprehensive response to their health crisis.

E.811

STATE OF THE ART MEDICAL CARE FOR AIDS PRISONERS

Bellin, Eran; SAFYER, S.; BRASLOW, C.; MONTEFIORE MEDICAL CENTER RIKERS ISLAND HEALTH SERVICE. QUEENS, N.Y. USA

Objective. To describe the medical needs of ambulatory AIDS prisoners and the complex policy considerations necessary in managing their care in a prison.
Method. A 40-man open dormitory for prisoners with CDC defined AIDS was organized for the delivery of prophylactic and therapeutic medical and mental health services on Rikers Island NYC. Rikers Island houses NYC inmates awaiting trial or who have been sentenced for periods less than one year.
Results. In the first 2.5 months 61 patients were cared for with a median age of 33 and median duration of diagnosis of AIDS prior to incarceration of 2 months (0,62). Major diseases experienced historically by our patients included: 50 PCP, 4 CNS TOXO, 3 large cell lymphoma, 1 B cell lymphoma, 2 extrapulmonary TB, 1 PML, and 1 cryptococcus meningitis. 8 patients were discharged to the hospital and did not return as of December 15. 7 patients had a history of TB and an additional 10 were PPD positive.10 had evidence of syphilis by history or screening blood test. A maximal temperature greater than 102 F was observed 3 times per 100 patient-days.

The treatment of AIDS patients in prison is fraught with conflicting objectives. The prison is a place of confinement and punishment while the physician's role is to heal and to relieve pain. The patient wants to improve his medical condition but also may benefit from appearing debilitated when considered for compassionate judicial release. Physicians wish to relieve legitimate pain even if pathology is not demonstrable; but they resist behavior perceived as purely drug seeking in nature.
Conclusion. AIDS patients can receive state of the art care in prison. One group's approach to the many challenges of prison AIDS care will be reviewed.

E.812

UNE APPROCHE INTERPERSONNELLE A LA REDUCTION DES RISQUES ADAPTEE A L'AFRIQUE CENTRALE

Payanzo Ntsomo, Walu Engundu, Rukarangira wa Nkera et Brooke G. Schoepf, Projet CONNAISSIDA, Kinshasa, Zaire.

La population adulte de Kinshasa, dans sa grande majorité, savait déjà en mi-1987, que le SIDA était une maladie fatale, transmise en grande partie par relations sexuelles avec des partenaires infectés. Néanmoins, peu de gens à risque changèrent les comportements qui rendent susceptibles à l'infection et beaucoup nièrent leur vulnérabilité. Cette communication résume les contraintes socioéconomiques, culturelles, cognitives et psychologiques. Elle présente une stratégie qui peut amener différents groupes parmi la population à prendre conscience de la nécessité de changement.

Basés sur les résultats des recherches ethnographiques, des ateliers furent organisés employant des méthodes d'enseignement actif. Les expériences structurées aident les participants à analyser leur situation et à se soutenir mutuellement dans les mesures à prendre. Cette méthode de communication interpersonnelle peut être utilisée par des organismes gouvernementaux, des réseaux informels, des services de santé et des écoles en conjonction avec des campagnes de communication de masse.

E.813

Tittle: Trends in prevalence of HIV infection among populations at high risk at Madrid.

E. Estebanez, F. Babin, MV. Zunzunegui*, C. Ortiz, , I. Pascual, C. Colomo, Madrid Council, *EASP Granada.

Objective: To study changes in HIV prevalence and coverage of the AIDS prevention and control program of the Center for Health Promotion located in the inner city of Madrid, during 1986-1988. Methods: 1504 IVDUs, 831 homosexuals, 94 IVDU prostitutes, 150 non-IVDUs street walkers, 338 sexual partners of high risk individuals, attending the Center. Prevalence, sociodemographic characteristics, high risk practices were studied among these high risk groups in each semester of the three years. Results: Prevalence of HIV among IVDUs remains around 60% during 1986-1987, decreasing slightly during 1988 to 55%. Prevalence of HIV infection among homosexuals started aaround 14%, increased to 26% and decreased to 12% in 1988. Among IVDU prostitutes, prevalence of HIV stays around 60%. Among the street walkers who are not IV drug users, there is only one seropositive, who is partner of a IVDU. In sexual partners of high risk individuals, prevalence varies around 8%. Coverage among IVDUs increases during 1987 in 100%. Among homosexuals, IVDU prostitutes and non-IVDU street walkers, coverage remains stable. Among sexual partners of high risk individuals coverage increases in 327% during 1987. Risk factors for HIV infection and sociodemographic characteristics associated with coverage will be presented. Conclusion: Prevalence of HIV infection remains stable among risk groups, without significant diferences. Coverage of the program increases during 1987, coinciding with national campaigns.

E.814

AIDS AND ITALIAN LEGISLATION IN WORKPLACE. PROBLEMS AND PERSPECTIVES.

Tarocchi Angiolo*; Agnoletto,V.*; Citterio,R.*; Caponi,F.*; Frigerio,L.* and Tradati,C.*
*L.I.L.A.(Lega Italiana per la Lotta contro l'AIDS),Milan,Italy.

Objective.To delineate problems and instruments to defend civil rights and right to work, in connection with HIV-infection in workplaces in Italy.
Methods.Problems and istruments have been evaluated on the grounds of known discriminations on workplace, consultations with workers and trade-union personnel, analysis of italian laws and regulations in force.
Results. A guide-platform has been elaborated, whose contents are: rights to work and to anonimity, uselessness of HIV/AIDS screenings, overcoming of delay period, health and safety on workplace, negotiation of work conditions and organization, work and health institutions (information, prevention, assistance etc.), social security.
Conclusions. Italian legislation contains instruments to face HIV-related problems on workplace and, if correctly enforced, defend rights, while putting in action aimed and detailed programs of information, prevention, counselling and requalification. Nevertheless, some adjustments regarding manifest-AIDS illness will be necessary. For these cases LILA has recently presented to the Italian Parliament a law for the non-dismissability, a monthly allowance and the validity of the period of illness for the pension.

SECTION F

Droit et éthique

Ethics and Law

Vue d'ensemble de la législation sur le SIDA
Global Survey of AIDS Legislation

M.F.0.1 THE HUMAN RIGHTS CONTEXT OF AIDS LAW

Justice Michael Kirly. Member, Global Commission on AIDS), Sydney, Australia.

In this paper, the speaker will stress the context of developing human rights jurisprudence within which national and subnatioal legislation dealing with AIDS and HIV must be developed. This is necessary not only because derogations from such norms diminish the effectiveness of such laws as measures for individual behaviour modification. It is also necessary because such norms are often legally binding on states and are morally binding as providing basic rules to be respected because of the very humanness of the person affected and his or her family and friends. The Global Commission on AIDS in its first report emphasised the necessity for WHO and national programmes and laws on AIDS to be developed with full knowledge of and compliance with universal human rights norms. These include rights to privacy, to establish a family, to move freely in international travel etc. Derogations from such basic rights must be provided by law, be proportional to the risk and limited strictly to what is necessary to prevent the spread of the HIV infection. Measures for public health do not provide a blanket exemption from compliance with basic rules of human rights.

M.F.0.3 STATE AIDS LEGISLATIVE AND POLICY TRENDS: 1983-1988

Rowe, Mona; Merritt, D.M.; Ryan, C.C.; Bridgeham, B.; and Bowleg, L.
AIDS Policy Center, Intergovernmental Health Policy Project, The George Washington University, Washington, DC. U.S.A.

Objective. To describe the response of state legislatures to the epidemic from 1983-1988 and to analyze the evolution of state AIDS policy on key issues affecting confidentiality, discrimination and prevention and the delivery of services. Method. All bills and laws were collected from all state legislatures from 1983-1988. They were analyzed by category, frequency and content from both a legislative and health policy perspective. Results. Since 1983, more than 1,456 bills and 314 laws have been passed by state legislatures. Categories reviewed include: testing, discrimination, confidentiality, health care services, financing, education and public health measures. More legislation has been introduced and passed regarding HIV testing than in any other area with related activity in areas of confidentiality and required disclosure. States are using AIDS to update their public health laws in terms of managing communicable, infectious and sexually transmitted disease. State handicapped laws and new provisions are being used to protect patients and providers from AIDS-related discrimination. Some states are taking a comprehensive approach to managing AIDS through omnibus legislation. A wide range of provisions including criminal penalties, due process for existing quarantine provisions, protections for anonymous testing and for health care providers are being added. Conclusion. Almost all states have passed AIDS legislation. Level of legislative activity does not always correlate with case incidence. Overall, final state actions evidence a measured, balanced, non-partisan response.

M.F.0.2 IMPLEMENTING HIV/AIDS LEGISLATIVE POLICY FOCUSING ON ETHICAL ISSUES IN A NATIONAL HEALTH CARE SYSTEM

Peterson, Marvelu*; Mather, S.H.*; Shelp, E.**; Stout, N.*; Sverha, S.*; Allen, R.*
*Department of Veterans Affairs, Washington, D.C., USA, **Foundation for Interfaith Research and Ministry, BelAire, Texas, USA.

Objective: To implement model Federal AIDS legislation focusing on significant ethical issues in the largest health care system in the USA.
Methods: In May 1988, the President signed Congressional legislation specific to the care of veterans with HIV infection/AIDS in the Veterans Administration. This legislation addresses significant ethical issues still subject to diverse opinion such as privacy and confidentiality of medical records; nondiscrimination in admission and treatment; self-determination and a voluntary testing program which incorporates the principle of justice and resource distribution. Broad policy direction including a system wide consent form has been sent to all health care facilities. A national training program on HIV/AIDS counseling and prevention education has been used as a forum to standardize the information process.
Results: Two counselors/educators from each facility in the system attend the course. The application of policy is discussed within the framework of ethical considerations every counselor should think about, such as mutual respect within moral pluralism, personal morality and professional limitations, professional duties, honesty in presentation of information; autonomy and consent and confidentiality and the thorny issue of spouse/sexual partner notification.
Conclusion: Despite a lack of moral consensus on some issues, legislation based on ethical issues can be implemented on a national scale.

M.F.0.4 THE LIMITS AND PROSPECTS OF AIDS LEGISLATION IN ANGLOPHONE AFRICA

AKAWASI AIDOO IDRC,DAKAR, SENEGAL.

OBJECTIVE: To survey and analyse the effectiveness of existing AIDS legislation in Anglophone Africa.
METHOD. Content analysis of existing health laws and AIDS legislation.

RESULTS: In most Anglophone African countries, specific legal instruments for dealing with AIDS prevention are lacking. Where AIDS-related health laws exist their application to the epidemic of AIDS is weak. The greatest potential for appropriate (i.e. humane) and effective AIDS legislation seems to be in those countries with better organized public health services, greater public awareness of the epidemic, legal sensitivity to the epidemic, and a tradition of human reghts legislation.
CONCLUSION: There is an urgent need for effective and appropriate legislation to deal with the prevention of AIDS in Anglophone Africa. Fulfilment of this need will help to significantly reduce the social stigma and criminalization of AIDS and HIV victims.

M.F.0.14 THE ETHICS OF INTERNATIONAL INEQUITY (OVERVIEW)

Koucher, Bernard. Paris, France.

M.F.0.15 INTERNATIONAL CODES OF RESEARCH ETHICS: SHOULD NUREMBERG AND HELSINKI BE SUSPENDED DURING THE AIDS EPIDEMIC?

Annas, George J. Law, Medicine & Ethics Program, Boston University Schools of Medicine and Public Health, Boston, Mass., USA

Objective: To establish the basis of international codes of research ethics and their relevance to AIDS drug and vaccine research today.

Methods: The basis for the Nuremberg Code and the Helsinki Code will be examined with a view toward establishing the universal principles contained in these Codes are their applicability to research conducted during an epidemic, and research conducted in countries that had not participated in the formulation of these Codes.

Results: Based on this analysis, it is possible to explain the legal and ethical bases of existing international codes of research ethics, including their "natural law" basis which would mandate their universal applicability. Special attention is properly focused on the principles of self-determination (autonomy) to be safeguarded by informed consent; nonmaleficence, to be safeguarded by adherence to reasonable scientific principles in research design and execution; and justice, to be safeguarded by fairly distributing the risks and benefits of the research.

Conclusion: The AIDS epidemic does not justify a suspension of the codes that safeguard human rights in medical research.

CONFIDENTIALITY AND ITS LIMITS: OVERVIEW OF THE ISSUES.

Closen, Michael L. Chicago, Illinois, USA.

T.F.0.2

X v Y (1988); WHEN IS CONFIDENTIALITY A LEGAL RIGHT? Harris, Dai; Legal Officer, The Terrence Higgins Trust Legal Centre. UNITED KINGDOM

Objective: To review the legal right of confidentiality to see when it is overriden by the public interest exceptions either to protect others or the freedom of the press.
Methods: When is information legally confidential as opposed to just private ? Examination of legislation and case law in the UK. Clinical information identifying people with AIDS in confidential (viz, NHS ((Regs)) 1974, and the case of X v Y (1988)). There is a primary duty to the patient to keep medical information confidential which may only be overriden by a doctor when it is in the public interest. Rarely, is it legally advisable to breach confidentiality to serve the wider public interest of protecting others. Only when there was a clear infection risk could a doctor be legally liable for failure to disclose.
Conclusion: X v Y (1988) 2 All ER 648, was a English court case concerning two doctors who had AIDS. A newspaper obtained the confidential hospital records identifying the doctors but the court granted an injunction restraining publication. The judge said that the confidentiality of the hospital records was more important that protecting the public from theoretical risks posed by the doctors, and the freedom of the press to publish such information.

T.F.0.3

THE STIGMA OF AIDS ON THE DEATH CERTIFICATE

King, Michael, B.

Institute of Psychiatry, De Crespigny Park, London SE5, U.K.

Death registration became constitutional law in England and Wales in 1836 and physicians have been urged ever since to accurately record the cause of death. Until the advent of AIDS, more liberal attitudes in society had reduced the stigma of most causes of death as an obstacle to their accurate certification. AIDS or HIV infection will usually appear on the Death Certificate as the condition leading to death or as another associated condition. This has major ramifications for the bereaved and may have particular implications for surviving family members with regard to placement of children in foster homes.

For historical reasons death records in most countries of the world are public documents and provide no safeguard for the privacy of sufferers after death. Patients with AIDS encounter many social and psychological problems and thus the importance of confidentiality has been established in guidelines provided by bodies such as the American and British Medical Associations. In the USA there have been calls to adopt a two part death certificate, mainly for purposes of reducing delay for relatives pending further clinical or autopsy information. However greater privacy would also result with a two part certificate, one of which, without stating cause of death, could be used for the legal and civil necessities after death.

T.F.0.4

AIDS AND PRIVACY: RETAINING, RESTRUCTURING OR ABANDONING MEDICAL CONFIDENTIALITY?
Glenn, H. Patrick*; Morissette, Y.-M.*; Gilmore, N.*; Somerville, M.*
*Centre for Medicine, Ethics and Law, McGill University, Montreal, Quebec, Canada.

Confidentiality of HIV/AIDS-related personal information (HIVARPI) has suffered from: (i) increasingly vacuous concept of medical confidentiality in era of institutional medical care; (ii) inability of formal law to control effectively flow of personal information. Further legislative regulation of medical confidentiality therefore unlikely to produce greater protection. Reliance should be placed on increasingly articulate soft law (guidelines, policy, protocols) to formulate precise measure of protection accorded particular category of HIVARPI. Measures proposed are known; systemic potential not been exploited. Each embodies inherent degree of protection. Measures of protection are: (i) unlinked, providing absolute protection; (ii) anonymous, allowing control exclusively by subject of information; (iii) coded, allowing control by designated individuals only; (iv) nominal, necessarily accompanied by stated further measures of protection. Mandatory, exclusive use of these measures of protection in all institutional settings will: concentrate attention on HIVARPI; prevent reliance on ineffective concept of confidentiality; provide courts with precise standards to measure alleged breaches of privacy and damages. Paper suggests application of measures to number of categories of HIVARPI. Method capable of extension to all personal medical information

T.F.0.5

AIDS AND THE CANADIAN PRIVACY ACT

Grace, John; Privacy Commissioner of Canada, Ottawa, Ontario, Canada

Significance of the Study. The study describes the impact of Canada's Privacy Act on the collection, use and disclosure of AIDS-related information about individuals. The level of confidentiality afforded this information may affect the degree of discrimination experienced by HIV-infected persons and may also affect the rate of spread of HIV infection. The study seeks to strike a balance between individual privacy and the legitimate needs of government to collect, use and disclose some types of AIDS-related personal information.
Methods. The study reviews Canadian government policies and practices for dealing with AIDS-related information about government employees, the general public and government clients (such as immigrants or penitentiary inmates). These policies and practices are assessed against the requirements of the Privacy Act about handling personal information. They are also assessed against the practical need to use some types of AIDS-related personal information to understand the syndrome and to combat the spread of HIV infection. It also addresses privacy concerns relating to HIV antibody testing.
Results. The study recommends measures to regulate the collection, use and disclosure of AIDS-related personal information. The recommendations will be useful for other jurisdictions attempting to strike an appropriate policy on the treatment of AIDS-related personal information.

MEDICAL PRIVACY FOR THE HIV-INFECTED INDIVIDUAL
Hockenberry, Clint, Administrator, AIDS Legal Referral Panel, San Francisco, CA, USA.

Partial Listing of 1988 Conferences

I.	National AIDSLaw Conf., S.F.	400 Participants
II.	Nev. Public Health Assoc., Las Vegas	100 Participants
III.	University of California, S.F.	1,000 Participants
IV.	Concern for Dying, N.Y.	50 Participants

Objective. To explore the lack of confidentiality protections for persons with HIV infection and generally to describe the decline of medical privacy.
Methods. Review of the concept of confidentiality within the physician/patient relationship. Examination of AIDS Legal Referral Panel case studies of health care providers' violation of Calif. confidentiality laws that resulted in injury to the patient. Analysis of limited exceptions to the general rule against disclosure of private medical information, including disclosure (1) after patient waiver, (2) to institutional staff, (3) to hospital visitors, (4) to a foreseeable victim of serious harm (Tarasoff), and (5) to others where health laws require.
Results. Despite the strongest confidentiality protections of any U.S. state, examination of pre-1989 California legal cases indicates erosion of medical privacy for HIV infected persons.
Conclusion. Communications between patient and care provider can no longer be considered confidential.

SIDA : LE SECRET MEDICAL BOUSCULE

M.P. LARHER*, J. CHARREL*, P. ENEL*, C. MANUEL*, J.L. SAN MARCO*

* Laboratoire de Santé Publique, Faculté de Médecine, Marseille, FRANCE

Aux Etats-Unis, il est prévu 200.000 cas de SIDA pour 1991. Les études épidémiologiques confirment les éléments déjà connus. Le SIDA atteint tous les continents et le nombre de cas est en augmentation constante.

Quel est le phénomène nouveau lié au SIDA qui bouscule les institutions juridiques de la santé ?
Les dispositions du code de déontologie médicale en France imposent au médecin le secret professionnel. Au corps médical incombe la lourde responsabilité de limiter le danger épidémiologique pour le groupe social et de respecter le contrat moral du secret qui le lie à ses patients sidéens.
Sur la base des codes de déontologie en application en France, en Grande-Bretagne, en R.F.A., et aux U.S.A. nous nous proposons d'étudier ce que prévoit la loi et ce qui se fait en pratique pour limiter un problème de Santé Publique qui s'aggrave.

T.F.0.8

MARTIN HEBERT, lawyer, Montreal, Quebec, Canada
AIDS, A SOURCE OF CONFLICT BETWEEN FUNDAMENTAL RIGHTS-
A COMMENTARY

No matter how fundamental they are, human rights do not have an absolute bearing and unconditional application. To respect the human autonomy, integrity, and dignity in enshrining confidentiality as a fundamental right in order that personal information be not disclosed to a third party without the consent of the patient is a matter. To give priority to the respect of confidentiality to the extent of jeopardizing the integrity and security of someone else is another matter. In certain exceptional circumstances, disclosing confidential information, or breaking professional secrecy may, in the last resort, prove to be justifiable.
After having attempted to make the sero-positive person responsible, after having failed in that effort of persuasion, after having attempted in vain by all possible means to protect the third party or parties truly threatened, in other words before a clear absence of alternatives, it may happen that one must ultimately choose between the respect of confidentiality of someone and the integrity of someone else.
The first purpose of the respect of confidentiality is not to jeopardize someone else. What confers solemnity to professional secrecy, is not the blessing it may give to a behaviour not only irresponsible but also objectively threatening. Hence when respecting confidentiality leads to such results, doesn't it amount to divert confidentiality from its purpose? If one must beforehand and unconditionally assure the patient of the respect of confidentiality in all circumstances, this does not only amount to a relation of trust that one wants to maintain but also a relation of complicity that one could built.

Éthique clinique
Clinical Ethics

T.F.0.10

Overview of the Issues
David J. Roy, Director, Center for Bioethics
Clinical Research Institute of Montreal, Canada

The most difficult clinical, ethical, and legal issues arise when we ask whether or when it is justified to withhold or discontinue aggressive life support to allow persons with seriously debilitating or with end-stage disease to die. The attempt to resolve these issues may generate conflict between the principles of philosophical and medical ethics, the current state of the law and jurisprudence, the maxims of clinical experience, and the variant moral persuasions and perceptions of people in societies as highly pluralistic as our own.

However, these issues arise in the care of patients afflicted with many kinds of conditions and diseases. They are not distinctive to AIDS. Moreover, these issues are not new. Attention here will be given to those issues that are distinctive to the treatment and care of AIDS patients. Some of these issues are: the physician's duty to treat; the attitude of professionals towards persons with AIDS; conflicts over confidentiality; the resuscitation of suicide attempts; how to manage requests for rapid, painless death.

T.F.0.11

"PHYSICIANS, ETHICS AND AIDS": A FRAMEWORK FOR ETHICAL ANALYSIS OF HIV/AIDS.
Somerville, Margaret A*, Gilmore, N*, and Canadian Medical Association**.
*McGill Centre for Medicine, Ethics and Law, McGill University, Montreal, Quebec, and **Ottawa, Ontario, Canada

Objective To develop a comprehensive framework within which: ethical issues relating to physicians and HIV/AIDS can be identified, defined and analyzed; relevant general principles and, second, any exceptions to these principles can be articulated; and recommendations indicating ethically responsible professional conduct relating to HIV/AIDS can be formulated.
Methods The principles adopted in developing this framework include: respect for persons; non-maleficence; beneficence; and justice. The framework has been based upon the presumption that HIV/AIDS should not be treated in isolation from other health and social issues, and that it should identify both the responsibilities and the rights of physicians relating to HIV/AIDS.
Results The ethical issues relating to physicians and HIV/AIDS can be usefully divided into three categories: 1) the generation and recording of information relating to HIV/AIDS; 2) the communication of such information; and 3) the allocation and provision of health services relating to HIV/AIDS. Thus, the framework includes:
1. GENERATION OF INFORMATION RELATING TO HIV/AIDS: includes issues raised by HIV antibody testing and screening of patients and of physicians, and the secondary generation of information from medical records and other documents;
2. COMMUNICATION OF INFORMATION RELATING TO HIV/AIDS: includes issues raised by communication to patients (informed consent, notification, and counselling), communication to others (confidentiality, reporting, and contact tracing), communication to health care professionals, and education of physicians and the community;
3. HEALTH CARE SERVICES RELATING TO HIV/AIDS: includes issues of rights to care (resource allocation, access to services, refusal to care or treat, research, and novel therapies), rights in care (standards of care and referral of patients) and specific services (e.g autologous transfusions).
Conclusion Ethical issues relating to HIV/AIDS must be examined within a framework that enables them to be comprehensively and thoroughly analyzed and connected with wider health and social issues. This framework will assist in accomplishing this aim.

T.F.0.12

THE ETHICAL DUTY OF HEALTH PROFESSIONALS TO CARE FOR PERSONS WITH AIDS AND HIV INFECTIONS

Jonsen, Albert R.; University of Washington, Seattle, Washington, U.S.A.

Objective. To review the ethical arguments in support of the obligation of health professionals to provide those medical services to HIV infected persons that would be provided to non-infected patients with similar medical needs.
Method. Critical review of the relevant published American literature on this subject.
Conclusion. There is a strong obligation to treat HIV infected persons equally with non-infected patients, even at risk to the provider. Exceptions to this duty are few.

T.F.0.13

HIV SCREENING FOR EARLY THERAPEUTIC INTERVENTION: AN ETHICAL ANALYSIS
Levine, Carol*, Bayer, R.**
*Citizens Commission on AIDS for New York City and Northern New Jersey, New York, NY, USA; **School of Public Health, Columbia University, NY, NY, USA

There is a growing sense among clinicians and patients, supported by early but incomplete research evidence, that early treatment of asymptomatic HIV infection is beneficial. In an ethical analysis of potential screening programs for clinical purposes, it is important to distinguish these purposes from other potential justifications for screening such as prevention of transmission, infection control, or epidemiologic surveillance. Early therapeutic intervention has both benefits and risks. Treatment is as yet unproven, costly, and with significant potential side effects. But AIDS is still ultimately a fatal disease, and early intervention offers both the potential of prolonging life and psychological benefits. Considering both benefits and risks, we conclude: (1) There is no justification for mandatory screening on the grounds of therapeutic benefit, for competent adults or for newborns. (2) There are now clinical grounds for routinely offering confidential or anonymous, voluntary HIV antibody testing to all those who may have been infected with HIV. (3) Testing of competent adults should be based on explicit informed consent. (4) High-quality laboratory services must be used. (5) HIV-infected individuals should be protected against discrimination. (6) Screening programs to identify asymptomatic individuals which do not at the same time plan for appropriate follow-up services fail to meet the ethical standards of justice or beneficence.

LE MéDECIN DIFFICILE
ROBERT,Jean. Département de Santé communautaire, Hôpital Saint-Luc,Montréal,Québec.Canada

Il est impossible au médecin et au soignant de ne pas réagir même émotivement devant un agent agresseur nouveau, une maladie jusqu'à récemment inconnue et surtout devant l'impuissance de la médecine à guérir. Pour plusieurs il s'agit de «la maladie du désespoir». Comme partie de la société bien pensante il éprouve de grands malaises à être confronté avec la sexualité, les sexualités et sa sexualité. Il se reconnait en terme de tranche d'âge, de groupe d'appartenance, chez ses malades sidéens, séropositifs ou tout simplement inquiets. Lui aussi manifeste de la négation (il refuse des soins), il manipule facilement (chantage thérapeutique), il agresse souvent à son insu (moralise sur la situation). Plusieurs se dépriment, décompensent, modifient ou cessent leur pratique. Sur le plan personnel certains paniquent, s'auto-prélèvent sous pseudonyme, et obtiennent des résultats préliminaires non encore confirmés. La pratique nous a confrontés avec des médecins toxicomanes, homosexuels/les, et aussi avec des médecins séropositifs ou sidéens. Le médecin peut, lui aussi, présenter des difficultés de comportement.

Clinical Ethics

T.F.0.16

OLIVIER Dr CLEMENT
CLINIQUE MEDICALE L'ACTUEL, MONTREAL
QUEBEC, CANADA

LE PATIENT DIFFICILE

Cinq prototypes de réactions des patients au diagnostic de séropositivité au VIH ou de SIDA sont abordés. La négation, la manipulation, l'agressivité, la dépression et la panique sont des réactions auxquelles les médecins ont à faire face. La dynamique patient-médecin engendrée par ces réactions est nouvelle à cause en partie du caractère imprévisible de l'évolution des aspects cliniques, psychosociaux et scientifiques reliés au VIH.

Ces réactions forcent désormais à une nouvelle approche du médecin qu'il est urgent de définir pour la survie du médecin et du patient devant l'intolérance sans cesse croissante d'une partie de la société et d'une partie du corps médical face au SIDA.

Devant l'absence de vaccin et de traitement efficaces, la confiance aveugle de la société envers les médecins s'estompe progressivement et tant que les médecins persisteront à se protéger derrière leurs armes thérapeutiques, le regard critique posé sur eux par la société s'accentuera.

Infection par le VIH, reproduction et fonction parentale
HIV Infection, Reproduction and Parenthood

T.F.0.17 Overview of the Issues

Bernard M. Dickens, Faculty of Law and Faculty of Medicine, University of Toronto, Canada M5S 2C5

Key ethical issues in HIV infection and reproduction arise at different stages of pregnancy. They include:

1. **Initiation of Pregnancy:** Counseling of the HIV-positive woman about risks of pregnancy to her health-directive or non-directive; advice about risks of HIV transmission *in utero*; access to reproductive assistance - gamete donation, *in vitro* fertilization, etc; screening donated gametes/donors for HIV; access to/supply of contraceptive means/sterilization.

2. **Maintenance of pregnancy:** Access to health services, pre-natal care, etc. for the HIV-positive woman; counseling on continuation/termination of pregnancy.

3. **Termination of pregnancy:** Access to abortion services and counseling; health care during and after delivery; risk to uninfected child of natural delivery - risk of infection by passage through birth canal/court-ordered cesarean delivery; post-natal care of HIV-infected child.

4. **Post-natal Issues:** Prohibition of breast feeding uninfected child - child abuse; foster parent/adoptive parent of infected/uninfected child-confidentiality and the (parental) right to know.

T.F.0.18 ETHICAL DILEMMAS IN PEDIATRIC AND MATERNAL AIDS

Willoughby, Anne, Wright, A. and Novello, A.

National Institute of Child Health and Human Development,
National Institutes of Health, Bethesda, Maryland, USA.

Objectives. To describe ethical dilemmas which are specific to pediatric and maternal human immunodeficiency virus (HIV) infection and disease.

Methods. The Secretary of the U.S. Department of Health and Human Services commissioned a major initiative to examine issues pertaining to pediatric and maternal AIDS in the U.S. The departmental experts who participated in this six-month long project identified a number of ethical concerns in this area.

Results. Areas of concern identified included: (1) the participation of infants and children in clinical trials; (2) the participation of wards of the state in clinical trials; (3) the risks to pregnant women of screening for infection; (4) confidentiality issues in testing and treating adolescents; (5) the conduct of clinical trials in pregnant women; (6) delivery of care to hard-to reach populations.

Conclusion. The AIDS epidemic has generated a number of problems unique to this disease entity.

T.F.0.19 SHOULD HIV POSITIVE WOMEN HAVE CHILDREN? AN ETHICAL PERSPECTIVE.

Arras, John D., Montefiore Medical Center - Albert Einstein College of Medicine, Bronx, New York, USA

In order to halt the perinatal transmission of HIV, advocates of a "public health" model of counselling contend that infected women should be strongly urged not to have children. Advocates of a "genetic counselling" model, on the other hand, argue on moral and practical grounds for a supportive, "non-directive" approach. This paper provides an ethical analysis of these competing claims and perspectives, and offers an alternative counselling model described as "respectful confrontation."

The ethical core of the debate turns on the question whether perinatal transmission of HIV constitutes a "harm" or "wrong" to the infected child. This question is approached through an application of the "wrongful life" argument and analogies with other devastating (genetic) diseases (Tay Sachs, cystic fibrosis). Then the factor of risk and uncertainty is addressed. Is a 25-30% chance of infecting one's child with a potentially lethal virus an unreasonable or irresponsible risk? While acknowledging much cultural diversity in perceptions of childbearing and risk, I note that society need not confirm such minority perspectives if the well-being of children is threatened.

Finally, the implications of these moral analyses for counselling are explored. I argue that if perinatal infection with HIV constitutes a harm or wrong to the child, and if the risk of transmission is judged to be very high, then "directive counselling" is not necessarily coercive or unethical. However, cultural differences separating counsellor from counsellee might subvert this approach. In order to spare future infants from undue suffering while paying heed to cultural differences, I advocate counselling that contests an infected women's initial preferences for childbearing, that compells her at least to see the problem as a genuine moral dilemma, before supporting her final decision.

T.F.0.20 UNINFECTED CHILDREN OF INFECTED WOMEN - THE HIDDEN PEDIATRIC EPIDEMIC

Landesman, S. - SUNY Health Science Center at Brooklyn-Brooklyn, New York

HIV infection in women creates a disease of the family. Not only is the women infected, but her newborn is potentially infected, her husband often ill with HIV disease and her healthy offspring suffer severely as a consequence of her illness. As infected women become ill, require hospitalization or die, the necessity of caring for their uninfected children will increase the burden on society and increase the risk of emotional and developmental damage to these children.

This problem will be most severe in cities where infected male IVDA's are numerous (e.g. Newark, NYC, Jersey City, Washington D.C., Boston); these men serve as the reservoir for infection of women. New York City has an estimated 35,000 infected women each with average of 2 children/women (at time then HIV infection is first diagnosed). This means that over the next several years 70,000 children will be at risk of losing their parent. Often these children become orphans and end up in foster care because they live in single parent homes or the father has already died of AIDS. The foster care system of NYC currently cares for 21,000 children. How the potential addition of thousands or tens of thousands of new children into the foster care system will be handled remains unanswered. The problem is further complicated by social doctrines that place the highest priority on the biological mother's rights over her child and the foster care concept of making decisions "in the best interest of the child". In the social milieu wherein HIV disease is most common these doctrines are often in conflict.

More attention must be focused on the care of uninfected children of infected women if the social and human damage of the epidemic are to be minimized.

T.F.0.21 AIDS AND REPRODUCTIVE HEALTH IN THE AFRICAN SETTING

Onyango, Philista. Nairobi, Kenya.

T.F.0.22

HIV INFECTED CHILDREN IN THE COMMUNITY: ETHICAL PROBLEMS

Macklin, Ruth.

Albert Einstein College of Medicine, Bronx, New York, USA

Objective. To offer an ethical analysis of emerging problems regarding children with HIV infection in the community.

Methods. Cases are presented that pose ethical issues of confidentiality, school and pre-school placement, parental rights, and needs of children. Cases are drawn from the ongoing work of a multidisciplinary team established to deliver services to HIV-infected children and their families.

Results. Special problems arise when the need to preserve confidentiality conflicts with the "best interest" of children. Despite negative consequences of "labeling" children with AIDS, identification may be necessary in order for children to be eligible for special services or entitlements. Several potentially conflicting rights are identified: rights of the biological mother, of foster parents, of the HIV-infected child.

Conclusion. The chief ethical value should be "the best interest of the child," thus requiring subordination, when necessary, of competing values such as confidentiality of HIV information.

Recherche de traitements et de vaccins
Research for Treatments and Vaccines

W.F.0.1

ETHICIST'S ROLE

Robert J. Levine, Yale University School of Medicine, New Haven, CT, USA

The randomized clinical trial (RCT) is the gold stnadard for establishing the validity of medical therapies. RCTs must be conducted in accord with established ethical norms including: There should be a) sound scientific design, b) competent investigators, c) a reasonable balance of risks and benefits, d) informed consent, and e) equitable selection of subjects. This presentation is an overview of some of the more difficult ethical problems encountered by clinical trialists. Must subjects be informed that their therapy has been selected by chance? What should they be told about preliminary data and about alternatives to participation in the RCT? What is the role of the null hypothesis (or clinical equipoise) in the ethical justification of the RCT? Are placebo controls justified when subjects have lethal diseases? Is participation in a RCT a burden or a benefit? Should vulnerable populations be protected from the burdens of participation or assured access to the benefits of participation in RCTs? In what circumstances should alternative designs -- e.g., historical controls -- be considered? Satisfactory answers to such questions require careful consideration of the relevant facts about particular RCTs and prospective subject populations.

VACCINE TRIALS AND TRIBULATIONS: REGULATORY DISCRETION AND ETHICAL CHOICES IN TESTING CANDIDATE VACCINES

Mariner, Wendy K., J.D., LL.M., M.P.H.
Boston University Schools of Public Health and Medicine, Boston, Massachusetts, U.S.A.

The role of regulatory agencies in expediting vaccine testing will be analyzed in light of tension between the need for rapid worldwide distribution and the protection of human subjects. Most regulatory systems for licensing new vaccines were designed to maximize vaccine safety and efficacy, with less regard for the rapid development the AIDS epidemic requires. Yet such agencies have considerable discretion to determine what constitutes sufficient evidence to permit approval of a new vaccine. The way in which regulatory agencies exercise their discretion will strongly affect whether essential vaccines can be tested expeditiously without sacrificing public safety. Ethical principles applicable to research with human beings are difficult to satisfy in AIDS vaccine clinical trials, in part because the subjects are healthy people. Compliance with ethical principles may make the study design more inefficient and prolong testing. Proposals for testing vaccines in third world countries raise special questions about obligations to distribute affordable vaccines to subject populations and those at risk.

W.F.0.5

ETHICAL POINTS ON PLACEBO AND TREATMENT CONTROLS IN HIV DRUG TRIALS

Freedman, Benjamin; McGill University and the Jewish General Hospital, Montreal, Canada

Prominent proposals for changes in the drug approval process (e.g., the US FDA's treatment IND exemption) with respect to the treatment of HIV disease rely upon or entail the view that it is unethical and/or scientifically unnecessary to conduct controlled trials (the control arm using a placebo or a current therapy). Early understandings of the ethics of controlled trials presumed that each arm must be in a state of theoretical equipoise vis-a-vis each alternative arm, a state only satisfied when the evidence favouring any treatment arm was exactly as weighty of that favouring each alternative. A contrasting normative approach, clinical equipoise, has been developed by the author as a formal method of analyzing this ethical issue. Equipoise within the clinical community depends upon the known elements of the therapeutic index of the novel treatment in question (including etiologic rationale, functional/clinical effects, undesired side-effects, and exogenous factors relative to compliance, availability, mode of administration, and cost). As applied to AIDS drugs in particular, it is argued that control arms, though not necessarily placebos, should commonly be maintained, and that proposals presuming the contrary should be rejected.

W.F.0.6

THE ETHICS OF PLACEBO-CONTROLLED TRIALS OF THERAPY FOR HIV INFECTION

Kathleen Nolan, The Hastings Center, Briarcliff, NY, USA

To justify placing human subjects of research at more than minimal risk requires two separate ethical appraisals: one weighing risks against possible benefits to the individual subjects, and another weighing this first result against possible benefits to society.

Arguments about the legitimacy of placebo-controlled clinical trials often conflate these two separate appraisals. For example, a valid null hypothesis ("H_0") is often posited as the major ethical requirement for randomization in such trials, but hypothesizing therapeutic equivalence between an investigational agent ("X") and an inert substance ("P") addresses only the issue of whether the study design is sound and therefore likely to yield scientific (i.e., social) benefit. An equally important and often suppressed premise is needed to address the weighing of individual risks and anticipated benefits. This premise requires that a valid H_0 also attain between "P" and any alternative clinical intervention ("A"), especially in trials designed to treat serious or lethal conditions. If a superior alternative exists, then the highly unfavorable balance of risks to possible benefits for individuals in a trial of "X" vs. "P" outweighs even substantial benefit to society. In such circumstances, the substitution of "A" for "P" is ethically required. In addition, if the administration of "P" itself poses substantial risks to subjects (e.g., a control requiring repeated placebo infusions for immunocompromised children in a trial of IV gamma globulin), then alternative comparison groups and methods of blinding must be designed.

Recherche de traitements et de vaccins
Research for Treatments and Vaccines

W.F.O.7 SPECIAL PROBLEMS IN IRB REVIEW OF COMMUNITY-BASED AIDS RESEARCH

Merton, Vanessa*, ***, Levine, C.**, ***
*City University of New York Law School, New York, NY, USA;
**Citizens Commission on AIDS for New York City and Northern New Jersey, New York, NY, USA;
***Community Research Initiative, New York, NY, USA

Institutional Review Boards (IRBs) that review community-based AIDS research, like their counterparts in hospital-based or academic settings, are charged with protecting the rights and welfare of subjects. Fulfilling this charge presents all the challenges that face other IRBs, but with the added urgency of issues particular to the disease and the community setting. The IRB of New York City's Community Research Initiative is addressing these issues, among others:

1. Research design, especially the use of control groups. When, if ever, is a placebo trial acceptable? Under what circumstances are other options--dose-comparison, open-label, historical controls, or others--scientifically valid and ethically acceptable?
2. The relationship between scientific objectives and exclusion and inclusion criteria. Community-based AIDS research organizations are committed to the broadest possible access to promising AIDS treatments but some experts in research design believe that maximum homogeneity of subject population is optimal for generating valid data. Should an IRB adopt a broad or narrow approach to exclusion and inclusion criteria?
3. The acceptability of including subjects capable of reproducing in research protocols that may present risks of adverse reproductive outcomes. Should men or women be denied the opportunity to serve as research subjects in Phase II studies because of concern about risk to potential offspring?
4. The use of concomitant medications and alternative therapies. The "cleanest" study design is one in which subjects receive only the study drug or therapy, but many potential subjects believe strongly in the value of various nonvalidated alternative therapies. How should these views be accommodated in study design, and what level of compliance is it reasonable and ethically acceptable to ask from research subjects?

W.F.O.8 COMMENTARY

Levine, Carole. New York, N.Y. USA.

Prévenir la transmission du VIH : les conflits religieux en matière de santé publique
Preventing HIV Transmission: Religious Conflicts in Public Health

W.F.0.9 PREVENTING HIV TRANSMISSION: RELIGIOUS DIVERSITY, CONTROVERSY, AND PUBLIC HEALTH

Shelp, Earl E.
Foundation for Interfaith Research and Ministry, Houston, Texas, U.S.A.

The scope and severity of the HIV crisis suggest that religious traditions and institutions cannot escape addressing the multiple challenges that it poses. The diverse responses predictably have reflected the beliefs and moral commitments of particular traditions within a religious pluralism. The defining features of each tradition distinguish them from each other and provide bases for controversy and competition within and between them. General disagreements about how to respond to the HIV crisis tend to be based on differing understandings of deity's relation to the world, moral judgment and moral obligation, and the respective missions of religious and secular institutions. Efforts to prevent and decrease the transmission of HIV may be facilitated or impeded by how these basic issues of religious concern are interpreted, particularly in societies and cultures where religious institutions and authorities are influential. More specifically, the type and content of risk reduction activities and the relative emphasis placed on modifying individual conduct and social conditions will be affected.

W.F.0.14 "AIDS AND INDIAN ETHICAL VALUES"

Dr.D.V.P. RAJA, M.A.,D.S.S.A., Ph.D.,
General Secretary, Assn.of Schools of Social Work in India
&
Director, Madurai Instt. of Social Work
Madurai 625002 Tamil Nadu INDIA

AIDS, a deadly disease poses a threat not only to developed countries but also an approaching danger to developing countries The WHO estimates that 5 to 10 million people are now infected worldwide with the AIDS Virus - and most do not know it. Eight years have passed and a cure or vaccine for HIV infection is not found. When the disease becomes intractable, the only hope is to effect a change in the sexual behaviour and to improve the moral fabric of the society at large. When there are a number of ways to prevent the spread of AIDS, another effective means is by way of Indian traditional sexual conservatism. In India, the philosophy of traditional sexual conservatism has been voiced by Hinduism, Jainism and Buddism which propagate the sexual ethics of "stick to one partner" "self control", and abstinence. The Indian epics bring out ample evidences to this. The author suggests that wider acceptance of Indian traditional sexual conservatism by the Western World would serve as an indicator for combating the disease. Many concepts and philosophies concerning the above approach have been evolved which are versified in the religious and ethical books in India.

Prévenir la transmission du VIH : les conflits religieux en matière de santé publique
Preventing HIV Transmission: Religious Conflicts in Public Health

W.F.O.15 "SAVING LIFE AS AN OVERRIDING DEMAND" (A JEWISH PERSPECTIVE)

W. Gunther Plaut, Toronto, Ontario, Canada

Jews see the source of their moral demands as springing from their relationship with God. While not all Jews agree on what this relationship betokens, there are some common views which may be applied to the subject of the Conference on AIDS:

Life is precious and must be preserved under all circumstances and at all costs. While ordinarily the ends do not sanctify the means and the religious law must not be infringed for otherwise desirable purposes, it is different when it comes to the preservation of life and, by implication, the prevention of pandemic disease.

Prevention of HIV transmission may involve providing means for sexual activity which in itself is frowned upon by much of Jewish tradition. The liberal view (taken by the presenter) holds that the preservation of life must be tantamount, and that all possible support must be given to programs which will prevent people from becoming infected and from infecting others.

W.F.O.20 BAVARIA. A REVIEW
SYMPOSIUM - COERCION OR VOLUNTARISM: AN INTERNATIONAL CRITICAL REVIEW.

Jäger Hans.
AIDS Study Group, Schwabinger Krankenhaus, Munich, FRG.

Of the total of about 3 300 CDC AIDS cases in West Germany 17 % have been diagnosed and treated in Bavaria, one of eleven West German states ("Länder").
During the first months of 1987 a package of anti-AIDS regulations ("Bayerischer Maßnahmenkatalog") was decided by the catholic conservative majority within the Bavarian state parliament. Since then Bavaria has had a political and legislative AIDS position that - more in theory than in its practical consequences - contrasted sharply with the other 10 German states, with federal policies, with WHO recommendations and in part with scientific knowledge.
HIV testing in foreigners from non EC countries as well as in civil servants and judges to be hired, coercive steps against IVDU and male and female prostitutes and a 96 % (voluntary) testing rate within prisons were introduced.
Counceling, psychosocial treatment facilities and free anonymous testing in every private doctor's office were made available. No mandatory testing or reporting, no large scale screenings were organized. Several cases of criminal justice against HIV positive individuals rose concerns within human right groups in Bavaria and abroad. Homosexual men and many patients from other risk groups were unnecessarily frightened. Growing mistrust in public health authorities was noted.
No major exodus of AIDS patients was observed. Because of high standard basic research and clinical care especially in Munich, some patients are coming from other states as well as other countries to get treatment here.

W.F.O.21

Sweden: A Review on compulsive treatment, Gunnar Ågren, County Council of Stockholm, Stockholm, Sweden.

Swedish HIV-positive patients can be submitted to compulsive treatment if they don't follow the advice from the chief medical officer in the county. This is in accord with the law on control of infectious diseases. The law is, however, very seldom used. In Stockholm a special hospital department with two beds is used for this purpose.

HIV-infected drug addicts are more often treated according to a special law which permits compulsory care of alcohol and drug abusers for a time period up to 6 months. There is a number of special institutions for this kind of treatment. A cohort of 152 compulsory treated drug addicts, 58 of them HIV-positive, has recently been followed up. The results are not encouraging.

W.F.O.22 ETHICAL AND LEGAL ISSUES OF AIDS IN SOUTH AFRICA.

Knobel, Gideon J.
University of Cape Town, South Africa.

Objective. To analyze existing laws and effects on preventive, educational and health care programmes within an ethical framework.
Methods. Amongst others the Health Act, Sexual Offences Act, Admission of Persons to the Republic of South Africa Act, Media Act, the Medical, Dental and Supplementary Health Services Professions Act were analyzed.
Results. The Sexual Offences Act have a potentially counterproductive effect on homosexuals and prostitutes; regarding sexual contact with minors it has the inherent danger of a homophobic backlash and blackmail by male prostitutes over sixteen but under nineteen years of age. Listing AIDS and HIV infection as a communicable disease may dissuade persons with HIV infection or AIDS to seek medical help; it has the positive aspect of empowering the Medical Officer of a Local Authority to take action against a known infected person who persists with irresponsible behaviour. Declaring any foreign passport-holder with AIDS or HIV infection a prohibited person have potentially serious consequences for individuals. Existing health and education laws cause fragmentation of preventive, educational and health care programmes. The Medical, Dental and Supplementary Health Services Professions Act provide mechanisms for investigation of unprofessional conduct by Health Care Workers and the Media Act for investigation of improper media reporting.
Conclusion. Homosexuality and prostitution should be decriminalized; regulations on foreign passports-holders and HIV infection as communicable disease should be reviewed; the identities of persons taking legal action against breach of confidentiality and media exposure should be protected.

W.F.O.23 A HUMAN RIGHTS PERSPECTIVE

Justice Michael Kirby, (Member, Global Commission AIDS), Sydney, Australia.

Law is traditionally bound to a particular territorial jurisdiction. It typically reflects local cultural norms and historical institutions. But AIDS/HIV is international in character. Its global dimension provides an international context for the measures of response. National, subnational and international responses must be considered in the light of the developing jurisprudence of human rights. Not only does this require consideration of local constitutional or other guarantees now typically found in the laws of most societies. It requires compliance with developing international human rights law. This includes law declared by the Universal Declaration of Human Rights and established by such international instruments as the International Covenant on Civil and Political Rights. One function of WHO - and the Global Commission on AIDS - may be to remind member countries of the provisions of international law on human rights as it affects local responses to the epidemic. As the sorry history of past epidemics demonstrates, human rights are often the first casualties of a challenge such as AIDS. The thesis of the author is that this time we should do better. Not only is compliance with human rights a legal obligation and a moral requirement. It is also likely to be the only effective way of securing the cooperation of persons and groups most affected by the epidemic.

Th.F.0.1

DISCRIMINATION: THE ISSUES
ANAND, RAJ, CHIEF COMMISSIONER;
ONTARIO HUMAN RIGHTS COMMISSION

All persons with AIDS/ARC and/or testing positive for HIV are entitled to the full protection of the guarantees of equal treatment in respect of employment, housing, contracts, and the provision of goods, services, and facilities, as set out in Part 1 of the Ontario Human Rights Code.

The Code also protects persons perceived to have AIDS-related conditions or to be at high risk because of being members of certain groups. With particular reference to the erroneous perception of AIDS as a "gay disease," additional protection is provided through the explicit prohibition of discrimination on the group of "sexual orientation."

The Code provides that "a right under Part 1 is infringed where the discrimination is because of a relationship, association, or dealings with a person or persons identified by a prohibited ground of discrimination."

The Code sets out a broad duty to accommodate the needs of persons with handicaps, and may be of particular value to persons with AIDS/ARC/HIV.

Persons responsible for accommodating the needs of persons with handicaps may be relieved of their duty only if it can be demonstrated that the accommodation would cause undue hardship based on cost, outside sources of funding, if any, and health and safety requirements, if any.

Specific issues focus on testing for AIDS/ARC/HIV; infection control techniques; confidentiality; public education; and complaint handling.

Th.F.0.2

LEGAL SERVICES FOR PERSONS WITH AIDS (PWAs) OF PREDOMINANTLY HETEROSEXUAL, POOR, MINORITY BACKGROUND
Herb, Alice; LaGamma, D. Montefiore Medical Center, Bronx, New York, U.S.A.

Objective. To describe an innovative hospital based legal services program for PWAs from a poor inner city community.
Methods. Attorneys saw PWAs on weekly bed rounds; created policy and documents relating to health care decision making and child placement and custody; and integrated legal services into an AIDS interdisciplinary care team.
Results. PWAs at our center include 60% intravenous drug users (IVDUs), 25% homosexual men, 10% sex partners of IVDUs, 5% others. 25% are women. From 1/88 through 1/89, 65 PWAs requested legal counsel for 87 legal problems. Advance directives (living wills, durable powers of attorney & Do Not Resuscitate orders) and issues of child care and custody emerged as the principal legal concerns of PWAs at our Center. 43 PWAs discussed advance directives and were assisted in documenting preferences. There were 28 child related legal problems, most presented by parents (19 women, 9 men) living in non-traditional family settings without appropriate existing legal mechanisms. Preliminary data show that unemployed male IVDU were least interested in exercising legal rights and making choices for the future whereas women with children were most interested in legal assistance.
Conclusion. Legal services are an important part of interdisciplinary AIDS team care. PWAs and caregivers can be sensitized to the need for decisions on future health care and child custody.

Th.F.0.3

ANTI-DISCRIMINATION LAW & AIDS-RELATED DISCRIMINATION: A PHILOSOPHICAL ANALYSIS
Ducharme, Todd *; Hathaway, J.**
*Faculty of Law, University of Alberta, Edmonton, Alberta, Canada, **Osgoode Hall Law School, Toronto, Ontario, Canada

Objective: AIDS-related discrimination (ARD) has become an increasingly pervasive social problem. Almost universally, the legal response to ARD has been to attempt to protect the victims of such discrimination by using existing anti-discrimination law. However, ARD presents unique challenges as it involves fear of death and, in many cases, the "unclean" and "unknown". The authors wish to determine if conventional anti-discrimination law is capable of dealing with these dynamics.
Methodology: Human rights instruments and jurisprudence, both domestic and international, will be examined in order to identify the philosophical underpinnings of anti-discrimination law.
Results: The basic premise of anti-discrimination law is that the treatment of individuals should be based on relevant criteria and, in particular, that difference per se does not justify differential treatment. ARD occurs most often in circumstances where the fact that a person is HIV seropositive, has an HIV-related disorder or has AIDS is not a relevant concern. Thus, ARD can be understood as an unjustifiable response to difference.
Conclusion: Efforts to use conventional anti-discrimination law to combat ARD are justifiable. Difficulties arising with this approach are the result, not of any inadequacies in the law, but rather of an incomplete understanding of its theoretical framework.

Th.F.0.4

AIDS IN THE U.S. WORKPLACE: THE EVOLUTION OF AIDS LITIGATION, LEGISLATION, AND REGULATION
Heslund, Verla S. and Matthews, G.W.
Office of the General Counsel, Centers for Disease Control, Atlanta, Georgia, U.S.A.

Objective. To describe the progression from traditional public health AIDS recommendations to legislation and regulation relating to the workplace, and to analyze trends in AIDS-workplace litigation.
Methods. Reviewed all reported AIDS legal actions, summaries of federal and state legislation, and federal regulatory issuances.
Results. Some of the earliest AIDS litigation involved the workplace and employment-related legal issues. These cases continue to comprise a significant portion of all AIDS-related litigation. The majority of these employment cases also continue to resolve in favor of plaintiffs. The public health response to workplace issues began as published recommendations, initially focusing on the health-care workplace but later expanding to other work settings. These recommendations have frequently been introduced in legal actions and have been argued to have regulatory effect. In addition to recommendations, however, both federal and state governments more recently have responded with legislation designed to prevent transmission in the workplace. Workplace inspections and federal enforcement actions have also begun within the past year, and are expected to increase.
Conclusion. There has been a shift from reliance on recommendations to inclusion of the authority of statutes and regulations as a means to prevent transmission of HIV in the workplace.

VIH1 ET TOXICOMANIE : ASPECTS ETHIQUES
ESPINOZA Pierre, LETELLIER L.*, Pr. DAVID **
*Hopital de Fresnes (EHPNF) allée des thuyas 94261Fresnes.
** Hopital de Bicêtre78, rue du Gl Leclerc 94270 Le Kremlin

INTRODUCTION : la forte contamination par le VIH des toxicomanes IV, les problèmes sociaux liés à la drogue, à l'infection par le VIH incitent à analyser si les règles éthiques sont respectées à l'égard de cette population ainsi que le retentissement de l'infection dans l'entourage.
OBJECTIFS -METHODES: 150 toxicomanes incarcérés connaissant leur séropositivité depuis plus de 3 mois seront inclus dans l'étude. Conditions : consentement, confidentialité, anonymat. Etude des circonstances du dépistage, de la transmission de l'information (séropositivité) à la famille, aux partenaires sexuelles, aux surveillants, avocats, magistrats... Y-a-t-il une différence entre ceux qui ont appris leur séropositivité en prison et à l'extérieur - Le projet d'étude a reçu l'accord du Comité National d'Ethique, de l'Ordre des Médecins, de la Commission nationale informatique et liberté.
RESULTATS PRELIMINAIRES : (validation du questionnaire) Dépistage : 70% des cas en prison, 30% dans les hopitaux ou par les médecins généralistes - Test réalisé à l'insu du patient : 30% en prison, 30% à l'extérieur - Confidentialité respectée lors de l'annonce - Partenaire sexuel occasionnel jamais informé du résultat - Partenaire sexuel régulier : non incarcéré il informe sa(s) partenaire(s), en prison retard de l'information, attente de la libération, rupture du couple - Pas d'information de la famille, de l'employeur des codétenus - Surveillants informés :30% des cas - Demande de certificat 20% Avocat informé 30%, Magistrat au courant de la séropositivité : 40%

Th.F.O.7 DISCRIMINATION REFLECTED IN THE LANGUAGE AND DIAGNOSES OF TARGET HIV CLIENT BY PHYSICIANS

Norton, Robert*; Schwartzbaum**, J. & Wheat**, J. *Memphis State University, Memphis, Tennessee, United States, **University of Tennessee, Memphis, Tennessee, United States.

The object of this research was to see whether the language of physicians covaried with the type of diagnosis they would make for somebody who has been described as having the HIV virus. In addition to questions about how they talked about AIDS, each physician randomly received a one case study vignette. The only difference across vignettes was whether the patient was described as male or female, homosexual, or heterosexual, or white or black. Six hundred physicians were randomly sampled.

It was found that physicians discriminated in terms of diagnosis across vignettes. Also, how they talked about AIDS reflected biases. The language of physicians often reflected ethical biases relating to the AIDS problem. For example, out of two hundred and thirty two metaphors reported by general physicians in answer to the question, "AIDS is like ____________," some physicians responded with extremely judgmental replies: *"AIDS is the wrath of God." "AIDS is the plague brought to us by a minority of aberrant individuals,"* and *"AIDS is poetic justice, almost."*

This information is being used to craft educational programs which sensitize physicians and residents to ethical issues inextricably related to AIDS issues.

Global Survey of AIDS Legislation

M.F.P.1 LEGAL PROTECTIONS AGAINST HIV-RELATED DISCRIMINATION IN THE USA: A FIFTY-STATE ANALYSIS

Schatz, Benjamin*
* National Gay Rights Advocates, San Francisco, California, USA

Objective. To determine extent to which U.S. state handicap discrimination laws prohibit HIV-related discrimination in employment, housing, public accomodations, and other areas.
Method. Survey of state human rights agencies in 50 states and Wash., D.C.
Results. Clear majority of state agencies interpret state handicap laws to prohibit discrimination against people with AIDS, ARC, and asymtomatic HIV infection, although minority differ (see table below.) Majority also prohibit discrimination against uninfected persons considered "high risk." In addition to differences in statutory interpretation, other gaps exist in protection: 2 states have no handicap discrimination statutes, 3 state laws exclude "communicable diseases" from protection, 2 states prohibit only government discrimination. Although all state laws govern employment, only 38 cover public accomodations, 37 cover housing and 21 cover credit.

State Laws Protects:	Yes	No	Undecide
persons with AIDS	78%	8%	14%
persons with ARC	69%	8%	24%
asymptomatic HIV+ persons	65%	12%	24%
uninfected persons considered "high risk"	55%	18%	27%

Conclusion. Many people with HIV infection are unprotected from discrimination in the USA as a result of inconsistent state laws and policies. Nevertheless, consensus is developing that state handicap discrimination laws prohibit discrimination against people with AIDS, ARC, HIV infection, and others perceived to be at "high risk" for AIDS.

M.F.P.2 LEGAL AUTHORITY FOR HIV TESTING OF ADOLESCENTS

North, Richard, Associate Professor, University of Maryland School of Law, Baltimore, Maryland, USA.

Objective. To describe the risk of HIV infection in adolescents in the United states and to unravel the myriad laws in each state to allow for the voluntary HIV testing and counseling of adolescents without parental consent or notice to parents.
Methods. Analysis of the statutes in each state concerning medical care for minors, venereal and sexually transmitted diseases, emancipation and HIV infection. Analysis of case and constitutional law and the law relating to parental rights.
Results. Evidence in a number of studies points to the potential for a new wave of infection among adolescents in some areas of the United States. Little attention has been devoted to the risk to adolescents in the U.S. and the new laws designed to contain the infection ignore the special problems of adolescents.
Conclusion. Legal authority exists in all jurisdictions in the U.S. for the voluntary testing and counseling of minors but that authority is usually not found in venereal or sexually transmissible disease statutes. The sources of authority differ from state to state as do the requirements of confidentiality and notice to the parents of minor patients. A chart describing the sources of authority and confidentiality requirements in each state is offered.

M.F.P.3 IMPACT OF THE SANITARY LEGISLATION ON HIV TRANSMISSION IN BLOOD DONATIONS IN GUADALAJARA, MEXICO.

Vázquez-Valls, Eduardo*; Torres-Mendoza, B.*; Jauregui-Rios, ML.* and Soto-Sánchez, E.*
*Instituto de Patología Infecciosa y Experimental "Dr. Fco. Ruiz Sánchez" de la Universidad de Guadalajara, Guadalajara, Jalisco, México.

In México, since May 1986, the mandatory detection of antibodies anti HIV in blood and it is derivates for the use in humans was legislated, one year later the prohibition of blood trade took effect.
Objective. To compare the impact of the sanitary legislation to mandate screening for HIV antibodies in blood donations in Guadalajara, México.
Methods. An aleatory sample was taken from 5228 sera of donors of six public and privates blood banks in Guadalajara, between June 1986 and June 1988; 4020 in the first year and 1208 after mandatory; in all the samples the presence of anti HIV antibodies was determined by the ELISA assay and positive ones were confirmed by indirect immunofluorescence and/or western blot.
Results. During the first, year, the seroprevalence fluctuated between 2.01 and 30.15% depending on different factors, compared to the second year where the seroprevalence was 0.17%.
Conclusion. It is concluded that the mandatory detection of antibodies anti HIV and the prohibition of blood trade, have been definitive factors in decreasing the incidence of HIV in blood donors in Guadalajara, México.

M.F.P.4 PHYSICIAN BREACH OF PATIENT CONFIDENTIALITY AMONG INDIVIDUALS WITH HIV INFECTION: A PRELIMINARY INVESTIGATION OF RACISM, SEXISM, AND HOMOPHOBIA.

Judith Schwartzbaum* John Whear*, Robert Norton**
*University of Tennessee, Memphis, Tennessee, USA, **Memphis State University, Memphis, Tennessee, USA

To determine whether the sex, race, or sexual preference of an HIV infected patient influences a physician's decision to breach patient confidentiality, 222 Tennessee primary care physicians were each mailed a questionnaire containing a case study in which an HIV infected patient presented a risk to a third party. Eight different descriptions of the sex, race, and sexual preference of the hypothetical patient were distributed equally among the physicians who were asked to decide whether to maintain confidentiality, notify the health department or inform the patient's partner. Physicians said they would report a black male heterosexual to the health department 16.1 (1.7, 150.3) times more often than they said they would a black female homosexual. Physicians with increased knowledge of AIDS were 50.4 (2.8, 888.0) time more likely to say they would inform the partners of black heterosexuals than those of black homosexuals. These physicians were also significantly more likely to report male heterosexuals to the health department than they were female homosexuals. Physicians reporting confidence in their knowledge of AIDS also said they would report male heterosexuals to the health department with greater frequency (odds ratio 59.2 [6.0, 581.9]) than they would female homosexuals. These physicians were 9.6 (1.8, 50.8) times more likely to say they would inform the partners of black males than they would those of white males. When physicians decide to protect a third party by breaching an HIV infected patient's confidentiality, they consider the race, sex, and sexual preference of the patient.

M.F.P.5 CURRENT ISSUES IN DRUG REGULATION IN THE U.S.A.

Smith, Stephen C., Human Rights Campaign Fund, Washington, D.C., USA

Objective. To identify and analyse key issues raised by current proposals to reform the legal regulation in the United States of the sale of drugs for medical treatment.
Methods. The author is an attorney and lobbyist concerned with AIDS policy in the USA, has read a number of legislative and regulatory proposals to this end, reviewed the literature, and attended conferences where these proposals have been discussed.
Results. Current proposals for legal reform of drug regulation have attained new urgency in the public debate as a result of the AIDS crisis. It has been proposed that medical drugs be "de-regulated" by eliminating the efficacy requirement, or the requirement of a doctor's prescription, and related rules of civil liability. It has been proposed that the governmental role of reviewing and certifying drug tests be either eliminated or made purely advisory. It is claimed that de-regulation will make effective drugs more widely available to patients and enhance individual choice. The strongest objection to this claim is that competitive pressures will result in "bad" drugs driving "good" drugs out of the market.
Conclusion. Empiric research is needed to establish the benefits and costs of a legal requirement that medical drugs be proven effective before sale.

M.F.P.6 TRENDS IN AIDS LITIGATION IN THE UNITED STATES - 1983 TO 1988

Matthews, Gene W. and Neslund, V.S.
Office of the General Counsel, Centers for Disease Control, Atlanta, Georgia, U.S.A.

Objective. To review published cases involving AIDS litigation to identify current legal trends.
Methods. Over 300 legal actions occurring in the past 6 years (1983 through 1988) were reviewed and categorized. Comparisons were made by category between the earlier cases (1983 to 1986) and the more recent cases (1987 to 1988).
Results. Within certain categories, litigation patterns established prior to 1987 have continued over the last two years, including a significant number of legal actions involving prison-related AIDS, employment discrimination, and sanctions against recalcitrant HIV transmitters. However, new patterns have also emerged since 1986, such as decisions involving appropriate uses of the HIV test and decisions disclosing the names of blood donors to transfusion AIDS plaintiffs.
Conclusion. During the past 2 years the number of reported AIDS legal actions has more than doubled the total that were reported during the preceding 4 year interval of 1983-86. Within this rapidly expanding framework, a significant body of AIDS law is now taking shape.

M.F.P.7

AIDS AND THE COURTS: COMPELLING AND PROTECTING THE DISCLOSURE OF AIDS STATUS

Morissette, Yves-Marie; Glenn, H. Patrick; McGill Center for Medicine, Ethics and Law, Montréal, Canada.

Court proceedings, whether civil or criminal, require under certain conditions the compulsory collection and the public disclosure of medical information. An AIDS patient may thus be forced to divulge his status in order to bring or to defend an action, including one not directly related to his illness. This paper discusses the competing legal policies which favour the confidentiality or the disclosure of a person's AIDS status in adversarial systems of procedure. Bearing in mind the desirability of protecting the privacy of AIDS patients, the authors examine (i) basic evidentiary principles, such as relevance, privilege and confidentiality, (ii) forms of compulsory discovery, including physical examinations and access to medical records, and (iii) the extent to which judicial proceedings and court records are and must remain open to the public. The idea of proportionality is central in this analysis. In most jurisdictions which adopt an adversarial model of procedure, legal rules already in existence allow for a satisfactory resolution of the conflict between the privacy of AIDS patients and the public nature of court proceedings.

M.F.P.9

SIDA : PROBLEMES ETHIQUES POSES PAR LA PROTECTION DES DONS DE SANG

D.REVIRON, C.MANUEL, M.P. LARHER, J.CHARREL, P.ENEL, J.L.SAN MARCO*

* Laboratoire Santé Publique, Faculté de Médecine de Marseille, FRANCE

A partir d'une méta-analyse qualitative concernant les aspects éthiques du SIDA, et portant sur 400 articles, notre réflexion s'est arrêtée aux problèmes particuliers posés aux Centres de Transfusion Sanguine.

Les questions ont été soulevées dès 1983, avec des mesures d'exclusion pour les donneurs présumés à risques ; nous faisons une revue des Législations des différents pays, en suivant leur évolution depuis l'apparition des tests de dépistage.

Toutes les questions éthiques posées par un dépistage systématique des donneurs sont analysées : anonymat, consentement éclairé, confidentialité en ce qui concerne les résultats des tests, information des donneurs sur ces résultats.. D'autres points concernent la responsabilité des banques de sang en cas de contamination. L'information des receveurs sur les dangers d'une transfusion les dons de sang "dirigés", les dons d'organes ou de tissus.....

M.F.P.11

AIDS--ETHICAL, LEGAL, SOCIAL, AND ECONOMIC PROBLEMS

Joseph F. Lisa
New York City Council Health Committee Chairman
City Hall, New York, NY, U.S.A.

Objective. Examine the roles of ethics, health law, social and economic factors relating to the HIV epidemic.
Methods. Discussion of knowledge and truth as they pertain to communicable diseases and laws relating thereto and data collection as it relates to present and future social and economic stability.
Results. The need for public education on the ethical, legal, social, and economic scope of this problem. Our failure to accurately predict the future size, magnitude, and changes in the pattern of the AIDS epidemic may result in the risk of total collapse of the health care system. Without a specific model to predict the future, we are placing our fiscal integrity in jeopardy for if we underestimate the size of the epidemic, we will guarantee that the result will be uncompassionate care to all affected by the epidemic.
Conclusion. The establishment of a North American international AIDS (HIV) data base center would facilitate the collection, analysis, and distribution of HIV data that will encourage close collaborations between modelers and epidemiologists and assist the governments of Canada and the United States in taking the most appropriate actions to stem the HIV epidemic.

M.F.P.8

THE CONSEQUENCE OF LEGALISATION OF PROSTITUTION IN VICTORIA

Overs, Cheryl*
* Prostitutes Collective of Victoria. AUSTRALIA

The objective is to explain and analyse the relationship between recent reforms to prostitution legislation in Victoria and changes to the structure of the sex industry with reference to HIV susceptability of sex workers and clients.
Method The following structural features of both the legal and illegal sections of the sex industry will be discussed and compared: demography of participants; testing patterns, results and policy; industrial health and injury compensation; mechanisms for safe work practices and negotiation; policing; health; tax; planning and other regulatory activity. Conclusion Selective criminalisation and regulation of the sex industry may exacerbate the risks it aims to reduce where it simply reworks mistaken contextual understandings of sex work from old criminal law into modern administrative provisions.

M.F.P.10

COMPULSORY HIV/AIDS CASE-REPORTING: DOES IT PROMOTE OR INHIBIT PUBLIC HEALTH?

Hamblin, Julie: McGill Centre for Medicine, Ethics and Law.Montreal, Canada

Objective: To consider whether compulsory case-reporting of HIV/AIDS facilitates the collection of useful epidemiological data and the implementation of effective public health measures to control HIV transmission.
Methodology: A comparative analysis of case-reporting requirements in public health legislation in Canada, the United States, Australia and Great Britain.
Results: (1) In the jurisdictions studied, which all have a similar pattern of HIV infection, HIV/AIDS case-reporting requirements vary enormously in their scope and content; (2) Most HIV/AIDS reporting requirements have been added to already-existing disease-reporting requirements under public health legislation; (3) This traditional approach does not always achieve the desired objectives in the context of HIV/AIDS. It can be too narrow (the provisions do not meet the specific requirements of public health measures) or too broad (the provisions are more restrictive of rights than is necessary for public health purposes); (4) There is often little or no statutory protection for the confidentiality of information reported.
Conclusions: (1) The lack of uniformity in case-reporting requirements indicates uncertainty about the benefits and harms of case-reporting in achieving the aims of reducing the spread of HIV and obtaining necessary epidemiological data.

(2) Compulsory case-reporting can defeat these aims and cause other harm by: (a) discouraging voluntary testing and treatment; and (b) distorting epidemiological data if inappropriately-worded and non-uniform provisions are used.

(3) Some of the aims sought to be achieved by compulsory case-reporting may be better achieved by other, less harmful, means, eg. unlinked testing of population groups, encouraging voluntary behaviour changes.

(4) Respect for individual rights demands that case-reporting requirements be drafted as narrowly as possible while still achieving the desired public health objective; the majority of requirements studied do not meet this test.

(5) There is an urgent need for HIV/AIDS case-reporting requirements to be re-evaluated: (a) to ensure collection of accurate and uniform data; (b) to protect individual rights to the greatest extent possible; and (c) to avoid obstructing and to maximise the effect of efforts to reduce the spread of HIV.

M.F.P.12

THE IMPACT OF LAW AND POLICY ON NEEDLE EXCHANGE PROGRAMMES IN CANADA

Orkin, A. and Duffie, Anne;
McGill Centre for Medicine, Ethics and Law, Montreal, Quebec, Canada

Objective. To evaluate policy and law as factors impeding public health initiatives aimed at preventing the spread of HIV amongst intravenous drug users in Canada.
Method. Analysis of Canadian policy and legislative approaches to illicit drug use and their impact on the distribution of needles and syringes to those who cannot or will not stop such use.
Results. The response to illicit drug use in Canada, mirrored and influenced by that of the U.S., has generally been crimino-legal. Opiate use was criminalized in 1908 as an indirect result of anti-Asiatic riots. Subsequent legislation was also fuelled by demands for stronger control of illicit drug markets which criminalization had helped to create. Canadian narcotic legislation since 1961 imposes harsh penalties for possession, trafficking, importation and exportation, but notably none for use. Treatment modalities have received little emphasis. The general climate is one of harsh societal disapproval of illicit drug use and drug users.

In contrast to the U.S., there are no specific laws in Canada prohibiting the possession of needles and syringes or their supply to intravenous drug users. (A recent Bill criminalizing possession, sale and distribution of "drug paraphernalia" failed to become law.) Government advisories and other factors have acted to dissuade pharmacists from selling "works" to intravenous drug users. At least one licensing authority has told physicians that the provision of needles and syringes to intravenous drug users is unethical and/or illegal. Those proposing programmes for the distribution of needles and syringes have expressed fear of criminal liability. Legislators have expressed fear of being perceived as encouraging illicit drug use, and funding programmes that apparently contradict historical responses to drug use.
Conclusion. The climate surrounding illicit drugs in Canada is a substantial obstacle to urgently-needed public health programmes to prevent the spread of HIV. Socio-politico-legal factors have frustrated distribution of syringes and needles to intravenous drug users in Canada; only one pilot programme has been established (Feb. 1989). A conflict is perceived between the urgent need for measures to prevent the spread of HIV and demands to suppress drug use. Increased efforts are required to persuade legislators and the public that these two goals are not incompatible, and that needle and syringe distribution appear not to encourage drug use.

M.F.P.13

STATE/LOCAL STRATEGIES TO PREVENT AND RESOLVE HIV-RELATED DISCRIMINATION: FIVE CASE STUDIES

Guthrie, Anne M.*, Sherwood-Fabre, L.*, Steele, R.J.**, Karsten, S.E.**, Lorenz, B.F.**, Ritter, J.L.**. *Office of the Assistant Secretary for Health, U.S. Public Health Service, Washington, D.C., **Birch and Davis Associates, Inc., Silver Spring, MD.

Objective: To identify successful processes for preventing and resolving complaints of HIV-related discrimination, and program features affecting replicability.
Methods: Five programs were selected for the study based on the existence of a relevant discrimination statute, availability of program documentation, and program experience. The project team visited all 5 sites (Los Angeles, CA; San Francisco, CA; New York City, NY; Philadelphia, PA; and, Olympia, WA), prepared case-study reports, and a final summary report.
Results: Litigation is rarely necessary to resolve complaints. Most often, discrimination occurs out of fear or ignorance, and interventions utilizing educational, mediation, and advocacy strategies are sufficient and timely. In addition, the programs' enforcement efforts appear to prevent some additional complaints. The programs may also provide technical assistance to persons seeking advice on their rights or obligations under the law.
Conclusion: The wide variety of site features suggests that the essential processes of these programs can be successfully adapted in many milieus. Further, the programs' successes in keeping persons in their homes and/or jobs tends to promote private sector involvement in the AIDS issue, and may limit the burden of the AIDS epidemic which is shifted to the public sector.

M.F.P.14

M.F.P.15

La confidentialité et ses limites
Confidentiality and its Limits

T.F.P.1 TRIAL OF CHEMO-PROPHYLAXIS OF HIV INFECTION AND THE HEALTH-CARE WORKER'S RIGHT-TO-KNOW VIS-A-VIS THE PATIENT'S RIGHT TO CONFIDENTIALITY

Bauer, Stanley; Bronx-Lebanon Hospital Center, Bronx, NY, USA.

Objective. To evaluate health-care worker's (HCW) rights vis-a-vis patients' rights in relation to possible chemo-prophylaxis of HIV infection in HCW after exposure in the workplace (WP) to HIV infective blood and body fluids (BBF).
Methods. The Burroughs Welcome Co., makers of zidovudine (AZT), is sponsoring a double-blind, placebo-controlled trial of AZT in the prevention of HIV infection in HCW after WP exposure to BBF of HIV antibody (Ab) positive patients. Animal studies suggest that early AZT treatment is most effective. A rapid reliable slide test is now available to detect HIV Ab in serum.
Results. HCW may join the trial after exposure to known HIV Ab positive BBF by phoning 1-800-HIV-STIK. However, if the Ab status of the patient is unknown, informed consent, to protect patient confidentiality, must be obtained to test the patient's blood for HIV Ab. If consent is denied, and HIV Ab status of the patient is unknown, the HCW may be excluded from the trial.
Conclusion. After exposure of a HCW in the WP, patients who's HIV Ab status is unknown should be tested with the rapid slide test, with or without the patient's consent, since HCW right-to-know of a potentially lethal hazard in the WP and possible subsequent exclusion from the AZT trial supercedes the patient's desire for confidentiality of results of HIV Ab testing.

T.F.P.2 CONFIDENTIALITY AND AIDS: A CANADIAN PERSPECTIVE

MacMillan, Robert M.*; Barnes, M.E.*

*Ministry of Health, Ontario, Canada

Objective: To explore legal, ethical and public health issues related to balancing the interests of the individual with respect to privacy of personal information, with that of protecting the health of the public.

Methods: The presentation will report the results of inter-provincial consultation and collaboration on such areas as: 1. control of HIV testing facilities; 2. reporting requirements; 3. collection of epidemiological data; 4. contact tracing and counselling; 5. under which circumstances should information be disclosed and to whom. Information will include the results of an invitational conference for providers, patients and the public on these same issues as well as the results of a formal inter-provincial working group.

Results: The consultation has resulted in national agreement on definitions, general principles for HIV testing, basic data to be collected for testing, the role of public health authorities and primary care physicians, and guidelines for the following: i. disclosure of information to protect the interests of the HIV positive person; ii. disclosure to protect sexual or other contacts; iii, disclosure to protect the public; disclosure to protect patients of HIV positive physicians and iv. disclosure to and employer

T.F.P.3 CONFIDENTIALITE ET SIDA. UTILISATION D'UN CODAGE IRREVERSIBLE DE L'IDENTITE

X.THIRION, R.SAMBUC, C.MANUEL, J.L. SAN MARCO *
* Laboratoire de Santé Publique, Faculté de Médecine de Marseille, FRANCE

Objectif. Respecter le strict anonymat des patients tout en permettant les études épidémiologiques et économiques nécessitées par le SIDA.
Méthode. Utilisation d'un numéro d'anonymat : celui-ci est le résultat d'une formule de calcul irréversible. Il est impossible à partir de ce code de retrouver l'identité qui a servi au codage. Pourtant la formule de codage est publique et ne nécessite aucune clef.
Résultats. Validation de la non reversibilité du codage par le Service Central de la Sécurité des Systèmes d'Information.

Utilisation de ce numéro d'anonymat par les différents centres d'information et de Soins (CISIH), de même que par l'organisation responsable de la distribution des produits actifs contre le virus.
Conclusion. Cette méthode est opérationnelle et contribue à la protection de ces données médicales particulièrement confidentielles.

T.F.P.4 ETHICAL THEORIES APPLIED TO CONFIDENTIALITY IN HIV+ MALES

Dana J. Seiden, Union Theological Seminary, New York, NY, U.S.A.

Objective. Protection of confidentiality and prevention of further disease through an institutional policy.
Methods. Use of various established theories and models applied to the problems of the protection and limitation of confidentiality for persons with Acquired Immunodeficiency Syndrome (AIDS), AIDS Related Complex (ARC), or Human Immunodeficiency Virus (HIV). Application of these theories and models to the conflict between the medical tradition of absolute confidentiality between clinician and patient and the tradition of disclosing infectivity status to others at risk (if the presenting patient refuses), allowing these others to make autonomous changes.
This debate, while important for patients who are openly homosexual or intravenous drug abusers, is even more key for the bisexual male, often married, and with children or planning children, whose bisexual preference is not known to his family..
For medical practitioners and the ethicists who work with them, the dilemma is unavoidable. Often these patients belong to a family practice organization. Hence, their wives and children are patients of the same group of practitioners, balancing the value of confidentiality for the presenting patient against the value of protecting the health of the other patients also known to the practitioner. Yet, if a physician or group inform their other patients, will the presenting patients disappear, thereby losing any chance of their clinicians serving them and affecting their behavior?
The paper will include a sample protocol that attempts to apply ethical theories to these problems.
Results. With sustained counseling, most infected patients will voluntarily inform their contacts where they have not done so. Where physicians have done so, these patients have generally not been lost to treatment. There have been some notable and unfortunate exceptions.
Conclusion. Under certain circumstances, it is ethically permissible to break confidentiality, when the direct and immediate result is the probable prevention of disease, and there are no other means to accomplish this goal.

Éthique clinique
Clinical Ethics

T.F.P.5 "PERCEPTIONS AND ATTITUDES OF HEALTH CARE WORKERS ON ETHICAL AND SOCIAL ASPECTS OF AIDS IN A DEVELOPING COUNTRY."

Parimi Prabhakar & F. A. Orrett. University of the West Indies Mona, Kingston 7, Jamaica.

Despite the guidelines, AIDS has raised several controversial and unresolved ethical, social and legal issues in the health care profession.

In order to assess the perceptions and attitudes of Jamaican health care workers (HCW) on ethical and social aspects of AIDS, we conducted a survey in 4 Jamaican hospitals between July-August, 1988. 502 Questionnaires were sent to randomly selected HCW of which 379 were returned before the cut off date, a response rate of 75%. The affirmative responses (%) were tabulated for each category of HCW.

QUESTIONS	Doctors (n=140)	Nurses (n=112)	M.Techs. (n=44)	Radiographers (n=48)	M.Studs (n=35)
1. Confidentiality	20	8	9	11	23
2. Routine screening	33	78	55	63	51
3. Identity card	78	84	86	83	83
4. Special isolation hospital for AIDS patients	40	57	59	50	40
5. Sharing waiting room/toilet facilities	70	63	53	52	62
6. Extensive lab tests for opportunistic inf.	90	59	57	54	71

Our survey demonstrated that HCW do not differ in their perceptions and attitudes as compared with general public. Hence, HCW of developing countries need to be further educated themselves before they can educate the public.

T.F.P.6 A MODEL FOR FACILITATING PHYSICIANS' ACCEPTANCE OF RISK WHEN TREATING PATIENTS WITH AIDS

[illegible], Walter V.; Wallack, J.; Bialer, P.;
Beth Israel Medical Center, New York, NY U.S.A.

The refusal of physicians to treat patients with AIDS because of fear of infection is a recognized problem. Recently ethicists have proposed models based on altruism to encourage physicians to treat patients with AIDS. It is argued that these models will not have a wide enough appeal and that additional models that recognize physicians' self-interest are needed.

Physicians have always shown a mixture of altruism and self-interest, the proportions varying not only from individual to individual, but from one historical era to another. The period when all appropriately qualified physicians treated the contagious, a standard that is generally held today, lasted only a century (c 1850-1950). This was also a period when a high degree of paternalism was inherent in the physician's role and it is argued that the benefits of the paternalism, e.g. power, self-esteem, and admiration, compensated in part for the risk of infection.

Police officers and fire-fighters are respected and derive self-esteem because they risk their lives daily in the service of others. When a police officer or fire-fighter is injured or dies in the line of duty, he or she is considered a "hero" because the injury or death resulted from the willingness to assume the risks of the job. Seeing themselves, and being seen by others as heroes might provide additional gratification to some physicians to help compensate for the risk of infection. The first step in making physicians heroes is unequivocal support, emotional and financial, for anyone who seroconverts in the line of duty. Specific proposals to implement such a model and implications for other health-care workers will be presented.

T.F.P.7

CHUL* BIOETHICS COMMITTEE AND THE ANTI-HIV SCREENING TEST

Morissette M. R.** Mélançon M. J.**
*Centre Hospitalier de l'Université Laval (CHUL), Québec (Qc), Canada; **Comité de bioéthique.

Within 16 months, three requests for opinion concerning the use of anti-HIV screening tests were submitted to the CHUL Bioethics Committee by health-care professionals. The first request dealt with accidental infection with HIV among the surgical block staff (1988-02). The second request dealt with routine screening of anti-HIV for all patients undergoing surgery (1988-07). The third request was related to the management of fresh semen vs frozen semen stocks for the purpose of heterologous insemination (1988-04).
Objectives: To present (a) the positions adopted by the Committee, (b) the scientific, legal and ethical considerations that justified these positions, (c) the outcome of these requests for opinion submitted to the Committee.
Method: The method adopted by the Bioethics Committee is as follows: (a) creation of a multidisciplinary task-force (medicine, ethics and law) upon reception of the request for opinion; (b) submission of a preliminary paper to the Committee; (c) discussion of and modification to the preliminary paper by the Committee; (d) issue of a unanimous opinion by the Committee.
Result: These opinions are now part of CHUL internal policies regarding the use of the anti-HIV screening test.
Conclusions: 1. The fear of possible accidental contamination by HIV among health-care professionals is very high. 2. Health-care professionals are aware of the ethical dimension in the use of the anti-HIV screening test.

T.F.P.8

A LEGAL OR ETHICAL DUTY TO WARN: ONE LAST TIME

North, Richard, Rothenberg, K. Associate Professors, University of Maryland School of Law, Baltimore, Maryland, USA.

Objective. To reconcile the moral, institutional, public health and legal principals bearing upon the existence of a duty owed by professionals to warn unsuspecting third parties that a patient or client knowingly places that third party at risk of HIV infection.
Method. Reviewed the medical, ethical, and legal literature concerning the "duty to warn" and summarized the arguments. Evaluated the many proposals for legislation or for legal clarification of the moral dilemma.
Results. There are three primary values or goals competing in the debate: confidentiality, the public desire to block the spread of infection and the personal desire to avoid legal liability. These values are irreconcilable in some extraordinary factual circumstances. Law does not resolve these tensions nor should it be relied upon to do so.
Conclusions. Professionals are traditionally entrusted by society to make difficult decisions, distinguishing them from other occupations. On a case-by-case basis, professionals must determine if a warning (or other action) to a person at risk of infection is the highest "good." We propose a framework for making that decision which includes consideration of a professional's risk of legal liability.

T.F.P.9

ETHICAL STANDARDS IN THE CONTEXT OF HIV INFECTION

Norbert Specht, Ian Schäfer, Deutsche AIDS-Hilfe e.V.
Nestorstr. 8-9, 1000 Berlin 31, West-Germany

Objective: To determine ethical standards for obtaining medical data.
Methods: The Deutsche AIDS-Hilfe performed several seminars on ethical standards. Participants were people with HIV and AIDS, doctors, health care workers, philosophers etc.
Results: It was found that there is a lack of ethical standards in treatment, counselling and research with people with HIV and AIDS. An ongoing irrational fear of contracting HIV and AIDS is one of the main factors that substain people from dealing with HIV infection and AIDS in an objective way. The lack of ethical standards in collecting medical data leads to the suspicion of people with HIV and AIDS that their personal data could be misused and that treatment research is more for the benefit of the researcher and not for the person with HIV and AIDS. Conclusion: There is desperate need for national and international ethical standards for counselling and research. Specific proposals will be presented at the conference.

T.F.P.10

SIDA : LES DROITS DES MALADES

CHARREL Juliette*, LARHER M.P.*, ENEL P.*, MANUEL C.*, SAN MARCO J.L.*
* Laboratoire de Santé Publique, Faculté de Médecine, Marseille, FRANCE

Les réactions de peur et de rejet engendrées par le SIDA représentent un danger éthique par la remise en question des droits du malade qui régissent la relation médecin-patient : droit à la confidentialité, à l'information et aux soins.

Les défenseurs de la confidentialité présentent ce droit comme l'unique moyen d'entreprendre une prévention de la transmission, tout en respectant la dignité des malades.

Les opposants estiment que la levée du secret médical est le seul moyen de protéger la santé des contacts en palliant l'irresponsabilité de la plupart de ces malades.

Au sujet du droit du malade à l'information, les avis s'opposent sur quatre points principaux : l'accord du sujet pour la pratique du test de dépistage, la révélation de son affection au malade, l'obtention du consentement aux traitements et les modalités d'application des essais thérapeutiques dans le cadre du SIDA.

Quant au droit aux soins, il a pu être remis en cause par le SIDA, à tel point que les Assemblées Médicales se sont vues contraintes de rappeler solennellement ce principe d'éthique.

Un dialogue de sourds s'est souvent instauré entre défenseurs et détracteurs des droits du malade, entraînant parfois des prises de position excessives.
Au fil des années le monde commence cependant à apprendre à vivre avec le SIDA, et les problèmes peuvent être abordés de façon plus constructive.

T.F.P.11

APPROCHE ETHIQUE DU PHENOMENE SIDA : REVUE BIBLIOGRAPHIQUE

MANUEL Catherine*, ENEL P.*, CHARREL J.*, REVIRON D*, LARHER M.P.*, SAN MARCO J.L.*
* Laboratoire de Santé Publique, Faculté de Médecine, Marseille, FRANCE

Objectif et méthodes : L'étude bibliographique proposée a débuté par l'interrogation de quatre banques de données : Medline, CNRS, Bioéthics et AIDS, avec les mots clef suivants (associés au mot SIDA) : Ethique, Droits de l'homme, Confidentialité, Législation, jurisprudence. Un total de 412 références ont été listées de 1983 à fin 1987.

Résultats : Après lecture et analyse des publications disponibles et de langue courante (355), les législations adoptées dans les différents pays, ainsi que les principales opinions rencontrées dans les articles ont été répatoriées par thèmes et commentées.
La classification que nous proposons est la suivante :
1 - MESURES DESTINEES A PROTEGER LA SOCIETE
Avec en partant des plus coercitives : quarantaine et isolement, mesures discriminatoires contre certains groupes, levée du secret médical, application du code criminel, dépistages, déclarations obligatoires et Registres, protection des dons du sang, vaccins et médicaments nouveaux, essais thérapeutiques, information, éducation.

2 - MESURES DESTINEES A PROTEGER L'INDIVIDU
Droits fondamentaux du malade : droit à la confidentialité, à l'information et aux soins.
Droits civiques : liberté, droit à l'éducation, au travail, etc...
Droits de l'individu non malade : droits des contacts, sécurité du personnel soignant, des receveurs de sang, etc...

T.F.P.12

INFLUENCE OF HIV STATUS ON DECISION MAKING FOR NEWBORNS

Powderly, Kathleen E.*; Moreno, J.D.** and Levin, B.W.***

*Columbia University School of Nursing; New York, New York, U.S.A.
**State University of New York Health Science Center at Brooklyn, New York, U.S.A. ***Brooklyn College, Brooklyn, New York, U.S.A.

Objective. To describe the impact of maternal/infant HIV seropositivity on decision making for newborns.

It is clear that current HIV testing in the newborn does not yield results that allow for differentiation between maternal and fetal seropositivity. Newborn HIV status, however, is used by some physicians and nurses to justify treatment/management decisions. It is not always clear that alteration of the management plan based on HIV status is warranted. In addition, parents and parental surrogates (ie foster parents) may alter their decisions based on the HIV status.
Methods. Questionnaires administered to physicians and nurses in three metropolitan New York City neonatal ICUs and interviews with social service administrators.
Results/Conclusions. Preliminary data (both formal and anecdotal) indicate a newborn's HIV status influences decision making.

T.F.P.14

T.F.P.15

Recherche de traitements et de vaccins
Research for Treatments and Vaccines

W.F.P.1

THE TRIAL GIVETH, THE TRIAL TAKETH AWAY: THE EMOTIONAL COST OF STOPPING AN HIV TREATMENT TRIAL

Enders, Sheila; Flynn N., Jain S., Siegel B.
University of California, Davis School of Medicine, Sacramento, CA., U.S.A.

Objective. To demonstrate the emotional cost of offering participation in drug treatment or other research protocols to people with HIV infection or AIDS deserves closer scrutiny.
Methods. Six months following discontinuation of an HIV active immunotherapy research trial, a number of volunteers (16/57) were randomly contacted by telephone and sampled by questionnaire regarding their perception of their own emotional status and well-being prior to learning about the study, during their participation as potential study subjects, and upon cancellation of the study.
Results. Both positive and negative responses were noted with our cohort. Positive effects associated with entering the study included increase in social activities, optimism about their future, perceived enhancement of well-being, and development of bonding among cohort members. Negative emotions noted prior to entry in the study disappeared with selection for the study, but returned following study discontinuation. These included feeling socially isolated, depressed, and discouraged along with feelings of being "let down", "abandoned" and "panicked". Many volunteered with the hope of not only participating and receiving benefit from the most current research, but also, by volunteering, of helping someone else, even if not themselves.
Conclusions. Having reviewed the results of the random sampling of our cohort, we feel that intensive efforts need to be made to minimize potential negative effects of treatment studies on the emotional well-being of future study volunteers, including those not selected for participation.

W.F.P.2

ETHICAL AND CLINICAL CONCERNS IN HIV RESEARCH DESIGN

Kertzner, Robert M.; Todak, G.; McKinnon J.; Gorman J.; Ehrhardt, Anke. HIV Center for Clinical and Behavioral Studies, New York State Psychiatric Institute and Columbia University, New York, NY USA

Objective. To design a naturalistic follow-up study of HIV positive and HIV negative gay and bisexual men incorporating ethical, clinical, and pragmatic concerns and insuring high levels of subject satisfaction and return.
Method. Study policies were devised to balance naturalistic design with subjects' need for medical feedback and counseling, as needed; a method was established to share research findings with an eager and well informed cohort without biasing future data; and guidelines were created to protect subject confidentiality while allowing access to research data useful to individual subjects' ongoing medical care.
Results. Subjects evaluating initial study visit (N=204) reported high rates of relative satisfaction with their visit (203, 99.5%), perception that confidentiality had been handled well (199, 97.5%), and satisfaction with feedback from study internists (202, 99%) and neurologists (196, 96%). Of the 96 seropositive subjects scheduled to return for the 2nd study visit, 89 have returned; all 30 seronegative subjects scheduled to date for the 2nd study visit have returned.
Conclusion. HIV research can consider ethical, clinical, and practical issues in study design and achieve high rates of subject satisfaction and return.

W.F.P.3

ETHICAL AND LEGAL ISSUES IN CLINICAL TRIALS FOR HIV-INFECTED CHILDREN

HS Sacks, J Martin, Mount Sinai School of Medicine, New York, NY, USA

Objective: To explore methods of dealing with the complex issues of clinical trials in children with HIV infection.
Methods: We surveyed investigators at more than 40 centers across the USA, state and city social service agencies, ethicists and philosophers on issues of informed consent, ethics of placebo controlled trials, access to new treatments, impact of foster care.
Results: In the USA, pediatric AIDS has been concentrated in a few states, but the number of cases is growing in many urban areas. More than 30 centers are capable of offering experimental therapies and this number is also growing rapidly. In some areas up to 30% of HIV-infected children are in foster care. Only a few states have established procedures for enrolling these children in clinical trials.
There is wide diversity of opinion concerning criteria for deciding when use of placebo is appropriate.
Conclusion: Clear and uniform guidelines are needed to ensure that all children with HIV infection have equal access to new treatments, while at the same time, rights of the children and their guardians are protected. More communication is needed among all concerned with these issues.

W.F.P.4

LES PROBLES ETHIQUES POSES PAR LA VACCINATION ANTI HIV

EBEL Patricia*, CHARREL J., LARHER M.P., REVIRON D., MANUEL C., SAN MARCO J.L.*
* Laboratoire de Santé Publique, Faculté Médecine, Marseille, FRANCE

INTRODUCTION : Actuellement, le monde entier s'interroge sur la menace que représente l'épidémie de SIDA: la mise au point d'un vaccin anti-HIV devient urgente, mais pose divers problèmes difficiles à résoudre. En particulier, il existe une opposition entre la Santé de l'individu et la Santé Publique. Le premier but de la thérapeutique, c'est le bénéfice réalisé par le patient et pas forcément par la société. Quant il s'agit d'un nouveau traitement ou vaccin, les aspects éthiques prédominent.

Méthode : Notre équipe, formée de médecins de Santé Publique, a réalisé une recherche bibliographique portant sur 600 articles, abordant le thème de l'éthique face au SIDA. Nous nous sommes intéressés plus particulièrement aux aspects éthiques et légaux concernant la recherche d'un vaccin anti HIV.
Résultats : Ces problèmes se répartissent en trois domaines : les essais cliniques, la fabrication et la distribution du vaccin. Ils ne sont pas particulier au SIDA, c'est le contexte qui les aggrave : il existe une accélération des plans de recherche, une diffusion rapide et médiatique des résultats, et des pressions politiques, sociales et financières importantes.
CONCLUSION : Les essais thérapeutiques doivent faite l'objet d'un consensus rigoureux, soumis à des directives ou des avis internationaux. Les problèmes posés par la fabrication future du vaccin doivent être posés et résolus dès-à-présent. Quant à la distribution du vaccin dans la population, il semble qu'elle doive se faire sur une base générale (tous les individus et pas seulement les groupes à risque), plus ou moins volontaire.

Preventing HIV Transmission: Religious Conflicts in Public Health

W.F.P.5

MEETING THE MORAL CHALLENGE OF HIGH-RISK LIFESTYLES: AIDS AND EDUCATION

Illingworth, Patricia
McGill Centre for Medicine, Ethics and law; Montreal, Quebec, Canada.

Objective - To propose and apply criteria for the moral evaluation of education programs designed to change high-risk behaviour for the transmission of HIV. Such education programs have been strongly endorsed by ethicists, policy-makers, and lawyers as the most effective and ethical means for slowing the spread of HIV. Extensive research has been done supporting the claim that education programs are an effective way of changing high-risk behaviour. But education programs designed to modify behaviour have yet to be evaluated using the conceptual tools of ethical analysis to see how they fare from an ethical perspective. It has been almost universally assumed that education programs are either morally neutral or morally praiseworthy.
Method- Development of a concept of "autonomy" which can be used in the evaluative principle of "respect for individual autonomy" and application of the moral principle "respect individual autonomy" to AIDS education programs - (This is the methodology of applied ethics).
Results - The concept of "autonomy" adopted for the purpose of evaluating AIDS education programs emphasizes the centrality of awareness on the part of those targeted by education programs, about the means used to influence behaviour change. The methods of influence used to modify behaviour must be such that persons who respect their own autonomy would agree to have their behaviour influenced/ modified in these ways.
Conclusion - AIDS education programs which rely heavily on fear and peer pressure to modify high-risk behaviour do not satisfy the moral principle, "respect individual autonomy".

W.F.P.6

THE ETHICS OF INCREASING ACCESS TO STERILE SYRINGES AS AN APPROACH TO REDUCING PERINATAL HIV TRANSMISSION

Kathleen Nolan, The Hastings Center, Briarcliff, NY, USA

Ethical debate over efforts to reduce perinatal HIV transmission have focused primarily on three approaches: 1) influencing procreative decisionmaking; 2) notifying or counseling pregnant HIV-infected women regarding the risk of perinatal infection; and 3) intervening perinatally (e.g., through administration of AZT). Dissatisfaction with these approaches stems either from their lack of proven efficacy or the poor reception they receive from at-risk populations, combined with their threat to individual liberties if imposed in a coercive fashion.

Attempting to decrease the incidence of HIV infection by increasing access to sterile injection equipment is a more pragmatic approach, but it has been poorly accepted in the US, despite evidence that over 80 percent of infected infants are born to drug-using women and their partners. The major ethical objection to this approach is that it seems to send "the wrong moral message," symbolically making an inappropriate statement about drug use. Yet the emergence of HIV infection as a health risk to drug-users, and to their offspring, enormously magnifies the cost of avoiding the appearance of social sanction. Since the benefit to be achieved by social policies must be proportionate to the harms imposed on individuals affected by them, prohibiting access to sterile needles and syringes no longer withstands ethical scrutiny. Not to act to reduce lethal risks inherent in socially undesirable activities requires special ethical justification, especially when the risks extend to individuals not participating in the censured behavior.

W.F.P.7 Promoting Safer Sex

Maria Paalman*, Anthony Meyer**
*Dutch Foundation for STD Control, **GPA/WHO, Netheralands.

The Dutch Foundation for STD Control, co-sponsored by WHO, organized an "International workshop on the PREVENTION of Sexual Transmission of AIDS and onther STD" from April 30 - May 3, 1989. For this meeting 250 experts from the industrialized world were invited to debate the state of the art in promoting safer sex. Policy makers, executives and researchers exchanged information, discussed bottlenecks and future plans in 10 different workshops:

1. Men with homosexual contacts
2. IVDU
3. Prostitutes and their clients
4. Ethnic minority groups
5. Adolescents in and outside school
6. Std-patients
7. Women
8. General public
9. Policy makers
10. Condoms

The outcome of these workshops as well as the meeting as a whole will be presented.

W.F.P.9 JUSTESSE ET JUSTICE DU TRAITEMENT DU SIDA

Murbach, Ruth*
*Université du Québec à Montréal, Montréal (Québec), Canada

Le phénomène SIDA a bouleversé nos représentations sur la vie et la mort, l'espace public et privé, l'éthique médicale et le droit. Il a créé une situation de double incertitude, tant scientifique que juridique, dans laquelle décideurs politiques, acteurs du monde médical, patients et leur entourage doivent prendre des décisions inédites, chargées de sens à long terme. Prévention ou traitement? Tandis que l'opinion publique, informée par une presse dont l'histoire sera juge, vacille entre l'indifférence, le rejet et la peur et ne réagit guère aux campagnes de prévention, les patients séropositifs luttent pour l'espoir. Les succès de la recherche ont été spectaculaires, sans pourtant résoudre ni la question de la prévention ni celle du traitement. A partir d'une recherche en cours sur le développement, la recherche clinique et la commercialisation d'un nouveau médicament, l'AZT lequel, sans pouvoir-guérir réussit au moins à prolonger la vie de certains malades pour un temps encore indéterminé, nous chercherons à répondre aux questions de justesse (technique) et justice (politique et civique) que les mesures prises au Canada dans le traitement de la maladie et des malades posent.

W.F.P.8 FEMALE PROSTITUTION IN GLASGOW: HISTORICAL STUDIES

ST Green, DJ Goldberg, FA Green: Ruchill Hosp, Glasgow, U.K.

Prostitution was first recorded in the U.K. after Rome's Conquest (A.D. 43). Although illegal, it thrived throughout Medieval, Tudor and Elizabethan times. King James II and VII (r. 1685-8) owned his own brothel. Diarists Pepys (C17th) and Boswell (C18th) used prostitutes; Boswell noted the association with venereal diseases (VD). In Glasgow in 1841 (popn. 28 x 10^4), Police Superintendent H Miller knew of 1,475 female prostitutes, aged 15-20 years; many abused alcohol and drugs. Venereologist Dr W Logan estimated in 1842 that Glasgow's 1,800 female prostitutes served 36,000 clients weekly and generated £514,800 p.a. (1989 equivalent £25,740,000 or US$45,370,000); 300 girls died annually. In 1871, local newspapers identified 200+ brothels in a tiny area of the city; Dr Manney blamed it on "*drink, dress and the Glasgow Fair*". Dr A Patterson (1870-80) noted that the age of hospitalised female prostitutes with VD averaged 18-19 years, most having worked for 1 year or less. He observed that syphilitic prostitutes were reservoirs of infection which could disseminate into the wider population. Bidding to retard VD spread throughout the Armed Forces, the *Contagious Diseases Acts (1864, 66, 69)* provided for registration of female prostitutes: these laws were abandoned and replaced by the *Criminal Law Amendment Act (1885)*, which further criminalised prostitution, driving it underground. The *Glasgow Police Act (1883)*, an anti-vice initiative, was widely condemned as ultra-repressive. Laws tended to discriminate against women. Prostitution continues in C20th Glasgow: in 1988 Green and Goldberg identified 55 prostituting women. Repressive laws still form society's only official approach. AIDS, a 1980s phenomenon, has, like syphilis before it, strongly emphasised the need to study prostitution.

W.F.P.10 PRACTICAL AND ETHICAL INADEQUACIES OF PARTNER RESTRICTION AS A METHOD OF AIDS PREVENTION

Cole, Curtis*; Spiegel, L.** and Baker, L.*.
* New York Blood Center, NY, NY, USA.
** The New York Hospital-Cornell Medical Center, NY, NY, USA.

Objective. To evaluate the efficacy, practicality, and ethics of partner restriction as a method of AIDS prevention in light of current knowledge regarding the transmission of HIV.
Methods. AIDS prevention strategies, presented in publications produced by governmental agencies and gay advocacy groups, were reviewed with regard to current research on transmission and prevention. Empirical and theoretical justifications were sought in the literature for the strategies advocated.
Conclusions. The strategy of partner restriction, either by absolute number of partners, sexual history, relative risk of infection, or antibody test results, may slow the spread of AIDS in a population but it cannot stop it. Under certain theoretical conditions, simple partner restriction, without sexual behavior change, can even increase the risk to an individual. Partner restriction does not guarantee that the reduced partner pool will be free of infection. Attempts to determine the serostatus of a partner have inherent practical problems of honesty, accuracy, and incompleteness. Further, the recommendation of partner restriction raises striking ethical issues including discrimination against infected or at-risk individuals. Finally, an unwarranted sense of security may be felt by those who reduce their number of sexual partners to the exclusion of practicing safer-sex.

Discrimination et droits de la personne
Discrimination and Human Rights

Th.F.P.1 AIDS AND ETHICS

Levi, Guido Carlos* & Barros, Antonio Osório Leme de **
* Hospital do Servidor Público Estadual, São Paulo, Brasil
** Health State Secretary, São Paulo, Brasil

Objective. The authors prepared for the São Paulo Medical Council and the Brazilian Federal Medical Council a resolution regarding many ethical aspects on AIDS. Approved in 1988, it is now the official guideline for Brazilian medical doctors on this matter.

Methods. The subject was divided into six parts: introduction, AIDS and discrimination, relationship between doctors and patients (including patient refusal, respect towards the patient, patient's abandon and confidentiality), AIDS and institutions (including hospitals, blood banks and prisons), AIDS and Occupational Medicine and AIDS and medical research.

Results. A short resume of each of these topics will be presented.

Th.F.P.2 L'ETHIQUE DANS LES GROUPES COMMUNAUTAIRES

Sourdif, Isabelle
Comité sida aide Montréal, Montréal, Québec, Canada

Objectif. Décrire l'organisation d'un groupe de travail sur les aspects éthiques dans un organisme communautaire et les priorités à traiter.
Méthodes. Etude des besoins. Présentation des problèmes d'ordre éthique pouvant surgir dans un organisme communautaire. Quelles priorités établir? Actions à entreprendre? Objectifs? Qui doit faire partie de ce groupe? Critères? Structure? Fonctionnement?
Résultats. Elaboration de procédures d'acceptation des projets de recherche. Code d'éthique interne. Code d'éthique des professionnels et des bénévoles. Positions officielles de l'organisme. Confidentialité.
Conclusion. Nécessité de ce groupe de travail pour protéger les droits des personnes affectées par le virus. Voit au respect des individus (personnes atteintes, séropositives, bénévoles, permanents). Capacité de regarder objectivement un problème. Travail-réflexion.

Th.F.P.3 STATE/LOCAL STRATEGIES TO PREVENT AND RESOLVE HIV-RELATED DISCRIMINATION: FIVE CASE STUDIES

Guthrie, Anne M.*, Sherwood-Fabre, L.*, Steele, R.J.**, Karsten, S.E.**, Lorenz, B.F.**, Ritter, J.L.**. *Office of the Assistant Secretary for Health, U.S. Public Health Service, Washington, D.C., **Birch and Davis Associates, Inc., Silver Spring, MD. U.S.A.

Objective: To identify successful processes for preventing and resolving complaints of HIV-related discrimination, and program features affecting replicability.
Methods: Five programs were selected for the study based on the existence of a relevant discrimination statute, availability of program documentation, and program experience. The project team visited all 5 sites (Los Angeles, CA; San Francisco, CA; New York City, NY; Philadelphia, PA; and, Olympia, WA) prepared case-study reports, and a final summary report.
Results: Litigation is rarely necessary to resolve complaints. Most often, discrimination occurs out of fear or ignorance, and interventions utilizing educational, mediation, and advocacy strategies are sufficient and timely. In addition, the programs' enforcement efforts appear to prevent some additional complaints. The programs may also provide technical assistance to persons seeking advice on their rights or obligations under the law.
Conclusion: The wide variety of site features suggests that the essential processes of these programs can be successfully adapted in many milieus. Further, the programs' successes in keeping persons in their homes and/or jobs tends to promote private sector involvement in the AIDS issue, and may limit the burden of the AIDS epidemic which is shifted to the public sector.

Th.F.P.4 EQUALITY RIGHTS FOR PEOPLE WITH AIDS: MANDATORY REPORTING OF HIV INFECTION AND CONTACT TRACING IN ONTARIO

Flanagan, William F., B.A., LL.B. (Toronto), D.E.A. (Paris I), LL.M. (Columbia); Columbia University School of Law, New York, New York, U.S.A.

Objective: To examine the public health rationale and constitutional implications of (1) the mandatory reporting of HIV infection with identifiers and (2) an active contact tracing program supervised by public health officials (as is the present practice in the Province of Ontario).
Method: Examination of the equality rights provision under s.15 of the Canadian Charter. I present the view that protection for the physically disabled under s.15 extends to HIV infected individuals. I then examine whether the Ontario program, which prejudically effects the interests of the physically disabled, can withstand Charter review.
Conclusion: Because of concerns for confidentiality, the mandatory reporting of HIV infection with identifiers seriously discourages voluntary HIV testing, an essential element in preventing the spread of HIV. Mandatory reporting does not therefore serve the public health objective of controlling HIV. Although mandatory reporting does permit public health officials to enforce a contact tracing program, contact tracing is better performed by private physicians (where warranted) rather than public health officials. Physician- conducted contact tracing (even without the patient's consent) less seriously threatens the need for confidentiality because no state records of HIV infected individuals are maintained. Third parties at risk for HIV infection are thus notified without seriously discouraging individuals from seeking voluntary HIV tests.

Th.F.P.5 GOVERNMENTS' DUTY TO PROVIDE FINANCIAL ASSISTANCE AND COMPENSATION TO PERSONS WHO HAVE BECOME INFECTED WITH HIV THROUGH BLOOD TRANSFUSIONS AND BLOOD PRODUCTS.

Jacques J.M. Shore, Heenan Blaikie Law Firm, Montreal, Que.CANADA

Objective: I To review Governments' response to the demands for compensation by individuals who have contracted AIDS through the use of blood provided to them during routine medical/surgical procedures or by the injection of Factor VIII in treating hemophilia. II To identify legal principles and moral arguments to guide Governments in their decision to provide compensation or financial assistance.
Method: In addition to a brief review of the early history of AIDS, a glance at legal issues and relevant Canada/U.S. case law is made so as to predict the potential for success by utilizing legal methods for redress. Reference to international legal principles and domestic constitutional documents are made to support arguments. Compensation schemes in other countries and their legal bases are also identified. Results: The author explains that since certain Governments and their bureaucracies responded too slowly at the outset to the warnings that the infection was transmittable by blood, they now have a moral, if not legal, duty to those unsuspecting individuals who contracted the disease from contaminated blood.
Concl.: Those Governments which displayed little interest in the purity of blood supplies in its system or ignored the early danger signals breached the most elementary responsibility in the field of human rights; the right to life and the protection thereof. Such Governments have the duty to compensate hemophiliacs and blood transfusion recipients infected by HIV/AIDS.

Th.F.P.6 PROVIDING HIGH QUALITY, LOW COST LEGAL SERVICES TO PEOPLE WITH AIDS: A DISCRIMINATION LAW PROJECT

Barnes, Mark and Greenberg, D.
AIDS Law Clinic, Columbia University School of Law, New York, New York, USA

People with AIDS or HIV infection, as well as persons only perceived to have AIDS or HIV infection, have experienced severe discrimination in employment, housing, access to health care and insurance. At the same time, because of indigence or near-indigence due to medical expenses, persons with AIDS have had very limited access to high quality legal help for their discrimination problems. In September 1988, the Columbia University School of Law opened an AIDS Law Clinic, staffed by two full-time faculty and sixteen students, each of whom devoted half their academic time to the Clinic and received one-half of a semester's course credit for their work. Operating under a special practice order from the local court system that allowed the students to function as formal legal representatives, the Clinic accepted referrals from local AIDS service organizations, local human rights agencies and public interest attorneys. The Clinic provided free legal services to its clients, and by February 1989, it had accepted representation in approximately thirty discrimination cases, with several cases already resolved in favor of clients who otherwise would have lacked any private legal counsel. By using law students as legal representatives, the Clinic has provided high quality, low cost legal services to an underserved population. It has also given law students valuable experience in the representation of clients and training in important policy issues. The AIDS Law Clinic can serve as a model for similar clinics at other professional schools.

Th.F.P.7 AIDS POLICIES OF CANADIAN UNIVERSITIES

Savage, Donald C.*; Blanchette, M.**

*Canadian Association of University Teachers, Ottawa, Canada,
**Canadian Association of University Teachers, Ottawa, Canada.

Objective: A study of the administrative and ethical policies on AIDS of Canadian universities in regard to their faculty, students and support staff

Method: By questionnaire and telephone follow-up with university administrations and the local representatives of faculty, students and support staff.

Results: Universities normally regard themselves as leaders in their communities. This research tests whether Canadian universities are acting as leaders in this area. It examines and analyses on a comparative basis the extent to which Canadian universities have developed policies both to deal with AIDS on the university campus and to educate the university community about AIDS. This involves in the first category such ethical and administrative matters as policies on confidentiality, restriction of access to some or all university facilities and programs, access to insurance programs, etc., and in the second category the type of program for educating staff and students and the investment therein.

Th.F.P.8 FORUM FOR CIVIL AND HUMAN RIGHTS BODIES ACTIVE IN AIDS WORK

The B.C. Civil Liberties Association
B.C., CANADA

Objective. To make possible a sharing of information and expertise in the specific areas of concern to governmental and non-governmental bodies concerned with the recognition and protection of individual rights in connection with AIDS.

Methods. To inform most of the Human and Civil Rights bodies in the world - including all Ombudsmen of every government - of the special focus of the 1989 International Conference on both social and scientific issues, and to encourage their participation in a special forum for rights bodies. The physical planning for such a forum can be organized on the basis of the response received to the correspondence with these bodies undertaken by the B.C. Civil Liberties Association.

Results. We suspect that many rights bodies would welcome an opportunity to explore together, in the supportive expert context provided by the International Conference, the special difficulties posed for individual rights by AIDS. Regulatory authorities would capitalize on an opportunity to sensitize rights advocates to the substantial public interests that policy makers must responsibly secure as they respond to the special plights of the AIDS person.

Conclusion. The Rights Forum, organized under the aegis of the International Conference, is an important step towards reconciliation of the perspectives of AIDS persons, their advocates, and the governmental authorities who must adjudicate their demands.

Th.F.P.9 HIV ANTI-BODY TESTING; is consent the legal issue?

Harris Dai; Legal Officer, The Terrence Higgins Trust Legal Centre.U.K.

Objective: To analyse the legal importance of patient consent, and to ask whether it ensures the proper use of the antibody test.

Method: Consent is important ethically and professionally. Testing without consent would undermine confidence in public health. Whereas voluntary testing is extremely useful. Positive or negative people can be advised to have safer sex directly by the doctor or clinic. Consent is required under UK law before a patient's blood is tested. Without expressed or implied consent there is no defence to the charge of assualt. People tested positive without consent can sue if, as a result, they lose their insurance, job or accommodation.

Conclusion Consent is an important legal issue in ensuring the proper administration of the antibody test. How the test is used may be the more important social and legal issue. Agreeing to take a test is fast becoming a standard pre-condition to be considered for insurance, a job or work permit in some countries.

This requirement is legal in the UK, should it be?

Th.F.P.10 A BILL OF RIGHTS FOR PERSONS WITH AIDS

Spiers, Herbert R., PhD*; Taylor, Clark*
*Issues Committee, ACT UP, N.Y., U.S.A.

The objective of this abstract is to describe the establishing of a Bill of Rights for Persons living with AIDS. Above all else, the medical, political and social rights of Persons with AIDS must be secured in the treatment of this disease. To ensure this objective, a Bill of Rights for PWAs must be drafted, discussed, ratified and promulgated. It will be developed primarily by Persons with AIDS, defined as anyone who is HIV seropositive and/or living with AIDS or ARC. This Bill of Rights will serve as a model to be presented to national legislative bodies, and to the United Nations General Assembly and the World Health Organization; it will contain recommendations for laws that will place the health and care of PWAs in the forefront of setting national and world policies on AIDS. Medical, moral, economic, political nd social principles effecting all aspects of AIDS (including but not limited to research, treatment, health care and pulbic policy) will be derived from what is beneficial for persons most effected by AIDS--those having the disease. Any and all claims, be they political, medical, economic, scientific, proprietary or social, conflicting with the principles in the Bill of Rights will be subordinated to the fundamental rights of Persons with AIDS.

Th.F.P.11 CATASTROPHIC RIGHTS

Dixon, John President, B.C. Civil Liberties Association, Vancouver, British Columbia, Canada

Objective. To define and explore the limits of a special instance of patients' rights in the context of catastrophic illness.

Method. To bring the disciplinary tools of Philosophy and Law to bear on the task of analysing the conflicting claims of the catastrophically ill and public health authorities in connection with the specific issue of access to experimental therapies, and the general issue of therapeutic self-determination.

Result. Considerable merit is discovered in the argument of public health policy-makers that important public interests are served by the social control of therapies. In opposition to this result, it is discovered that there exists a well-grounded claim, on the part of the catastrophically ill, to an to an enhanced right to therapeutic self-determination. Specifically, a symmetry between the right to refuse medical treatment (one of the most well-established rights of patients) and the right of the catastrophically ill to access experimental therapies is discovered and explored. When catastrophic rights are carefully balanced against the public interest sought through the governmental control of therapies, it is discovered that they have real, but limited scope.

Conclusion. Regulatory authorities should respond to catastrophic rights by carefully liberalizing access to some experimental therapies.

Th.F.P.12 THE INFLUENCE OF AIDS ON INDIVIDUAL RIGHTS AND THE DIGNITY OF PEOPLE.

Arredondo, C.; Conde, F. , Coronado, A.*, Gil, E.*,
Ministery of Health,-Spain.

Objective. The influence that AIDS is having on the rights of individuals and the dignity of people, what the social conception of it is, and the form in which different social groups learn about it has been studied. This has taken into account the fact that the repercussions of AIDS go far beyond daily social affairs, and that within society it is reflected as a Contagious-Incurable-Sole-Mortal-Fact that causes the inevitable physical deterioration and ensuing death, as well as inevitable social segregation.

Conclusion. This report presents research carried out by means of a representative survey of the Spanish population and has clearly shown that information and rational reasoning alone when dealing with AIDS are insufficient to undertake this problem which is strongly rooted in deeper "social fears".

Th.F.P.13 DEVELOPMENT OF COMMUNITY-BASED LEGAL SERVICES FOR PERSONS WITH HIV INFECTION

Hockenberry, Clint* and Savos, Michele**
*Administrator, AIDS Legal Referral Panel, San Francisco, CA, USA; **Consultant, American Bar Association's AIDS Legal Services Project, Washington, DC, USA.

Objective. To examine the need for free and low cost legal services for persons with HIV infection.
Methods. Examine the collaborative efforts of health providers and legal professionals in providing free and low cost legal services to persons with HIV infection. Analyze the special legal needs of U.S. citizens with HIV infection, including testamentary documents (e.g., Wills-on-Wheels programs for hospital and housebound clients), government entitlements, employment, insurance, bankruptcy, family problems and criminal representation. Review the legal profession's pro-bono response to the AIDS epidemic since the formation of the first AIDS legal service in 1982. Survey existing and planned AIDS legal services throughout the United States.
Results. AIDS service organizations, minority lawyers and local bar associations increasingly offer a legal component in the delivery of essential services to persons with HIV infection.
Conclusions. Free and low cost AIDS legal services are an essential component of community-based programs for persons with HIV infection.

Th.F.P.14 LEGAL NEEDS ASSESSMENT OF HIV-INFECTED MEN AND WOMEN

Saltzman, Brian R., Perlman DC, Clayton J, Colligan-Levine P, Lane C, Comeau L, et al.
Beth Israel Medical Center, Mount Sinai School of Medicine, New York, NY, USA

Objective: To determine the legal needs of HIV-infected men and women.
Methods: Hospitalized patients (pts) with known or suspected HIV-related disease were administered a standardized questionnaire, including mini-mental status examination, by trained personnel in an ongoing study to assess knowledge of legal issues, and the need to provide for child custody, wills, living wills, general and medical powers of attorney.
Results: Of the first 55 pts surveyed, 9 were unable to answer, 1 refused. 45 pts were available for analysis. 36 (80%) were male; 9 (20%) female. 21 (46%) were Hispanic; 20 (45%) White, 4 (9%) Black. 20 (45%) were intravenous drug users (IVDU), 18 (40%) homo/bisexual men, 4 (9%) had no identified risk, 2 (4%) homo/bisexual IVDU, 1 (2%) heterosexual partner of a person at risk. 37/45 (82%) needed wills for child custody or reasons of distribution of property. Only 8/37 who needed wills had them. Of those who needed wills, IVDU were less likely than non-IVDU to have made them ($p<0.02$). 20/45 (44%) had minor children. 10/20 (including 8/9 women) with minor children expressed a wish to have the children cared for by someone other than the child's other biologic parent. Only 3/10 had made custody arrangements for the children in the event of the pt's death. 13/45 (29%) knew what power of attorney was; 5 of 13 (all homo/bisexual men) had designated power of attorney. 5/45 (11%) knew what a living will was; 4/5 had a living will (all homo/bisexual men).
Conclusions: 1. HIV-infected patients have multiple legal issues which need to be addressed. 2. Women with AIDS frequently have child custody issues. 3. IVDU were less likely to have attended to their legal needs. 4. Persons with HIV-infection require education regarding and assistance in attending to a wide variety of legal needs. 5. Legal issues should be addressed early, while the patient is still capable of decision making.

Th.F.P.15 HIV ANTIBODY TESTING OF "CANADA WORLD YOUTH" (CWY) APPLICANTS

*Morisset Richard; **Roy David J.; ***Jobin Jacques et Joubert Jacques
*Hotel Dieu de Montréal, **Clinical Research Institute of Montreal; ***Canada World Youth, Montreal, Canada

Applicants accepted for "Canada World Youth" (CWY) projects are sent to 18 countries for four months. CWY youth in foreign countries are usually grouped into three cohorts of 12 youths each and located in three communities that may be anywhere from 50 to 125 miles distant from each other. CWY has an emergency blood transfusion programme within which CWY youth, in the event of an accident or emergency, serve as blood donors for their CWY colleagues.
Two questions have been asked. Is it ethically justifiable for CWY to require all Canadian applicants to submit to HIV antibody testing as a condition for acceptance into CWY projects? Is CWY ethically justified in using confirmed seropositive results of HIV antibody testing as a criteria for excluding applicants from its projects?
This paper will present the analysis and arguments to support each of the following answers to the above questions:
Answer to question 1: Canada World Youth would seem ethically justified in requiring HIV antibody testing of applicants as a condition for their admission into its projects. Adequate counseling and protection of confidentiality remain essential conditions for the ethical justifiability of such a testing policy.
Answer to question 2: Exclusion of asymptomatic HIV seropositive applicants from Canada World Youth projects is not necessarily unjustly discriminatory and ethically unjustified. There are good and sound reasons for such exclusion, and a policy excluding asymptomatic HIV seropositive candidates could satisfy the five conditions (necessary, effective, sensitive, specific, and proportionate) for ethically justifiable mandatory policies in specific contexts. It is essential, however, that confidentiality be protected and that exclusion from CWY projects not itself lead to public identification of which candidates are HIV seropositive and which are not. Provision of adequate counseling is an ethically essential component of such a policy.

M.G.0.1

EVALUATION OF THE PROGRAM FOR PREVENTION AND CONTROL OF BLOOD TRANSMISSION OF HIV (PPCBT) IN MEXICO.

Sepulveda J*, Garcia L*, Dominguez JL**, Valdespino JL*
*Directorate of Epidemiology, Ministry of Health. Mexico,
**National Center of Blood Transfusion.

Objectives: Evaluation of the Program for Prevention and Control of Blood Transmission of HIV (PPCBT) in Mexico.
Method: To design a strategy for the evaluation of donors, blood products and recipients, to measure the impact at short, medium and long term of PPCBT.
Results: The PPCBT in Mexico has been functioning for two years. Infrastructure, legal modifications and political will were required. The initial legal modifications based on a seroprevalence of 7% in paid donors, were mandatory detection of donors and prohibition of blood commerce. A national network of laboratories (NNL) was created. At present, seroprevalence in donors is 0.01 to 0.8%; 700,000 units of blood are transfused yearly. Main coverage problems are located in rural areas and small hospitals in urban areas. Measures taken to face this problem include the adoption of quick tests and the expansion of the NNL. Cases associated to transfusion increased from 2.5% in March, 87 to 11.2% in January, 89.
Conclusion: In those countries where the transmission of HIV associated to transfusion of blood products is important, it constitutes a bridge towards heterosexual and perinatal transmission. Measures to ensure the quality of blood should be extremed, including the prohibition of blood commercialization. The medium term evaluation shows that the measures adopted are still insufficient. It is expected that cases associated to transfusion continue to increase for some years. The adoption of quick techniques and consolidated purchases of reagents will allow the optimization of resources.

M.G.0.2

A regional perspective of HIV antibody testing in the Americas

M.V. O'Shaughnessy[1], J. Finlay[1], A. Meltzer[1], R. St-John[2]
F. Zacarias[2], M. Ritchie[1]
Federal Centre for AIDS, Health & Welfare Canada, Ottawa, Ontario, Canada

The Federal Centre for AIDS, Health and Welfare Canada, and the Pan American Health Organization co-sponsored the first international meeting of directors of national AIDS reference laboratories, Americas Region. The meeting, intended to assist countries in developing and strengthening the operational and scientific aspects of national HIV screening programs, was held in Touraine, Quebec, in August 1988 and was attended by representatives from 24 countries in the Americas. The meeting was preceded by four workshops at which small groups drafted position papers on: quality assurance, regional serum panels, standardization of the immunoblot and indirect immunofluorescence tests and laboratory networks. The papers were considered by the group as a whole, and consensus was achieved around the 4 topic areas.

Laboratory needs, practices and human resource requirements were assessed by questionnaire. The analyses indicate resource allocation, laboratory facilities, scientific expertise and testing protocols are highly variable within the region. Infrastructure analysis and the resulting adoption of an appropriate network could lead to improved service with a minimum of expenditure within any given region. Development and implementation of a model laboratory network is in progress.

M.G.0.3

DETERMINATION OF HIV-1 SEROPREVALENCE IN A COHORT OF 8000 INDIVIDUALS IN KINSHASA ZAIRE USING POOLED SERA COMPARED TO TESTING OF INDIVIDUAL SERA

Behets, F.*; Kasai, M.*; Ndilu, M.*; Brown, C.*; Ryder, R.*; Quinn, T.C.**. *Projet SIDA, Kinshasa, Zaire; **NIAID, NIH, Bethesda, Maryland.

Objective. To determine the accuracy and cost-effectiveness of testing pooled sera samples compared to testing individual sera samples in establishing seroprevalence of HIV-1 infection in an African population.
Methods. Serum samples from 8000 persons were tested by ELISA (Organon) and repeatedly reactive samples were analyzed by Western blot (DuPont). 800 pooled samples were made from this population, each containing 100 microliters from 10 different individuals. Pooled samples which were repeatedly reactive by ELISA were considered positive.
Results. The seroprevalence as determined by testing 8000 individual sera was 2.44% compared to 2.41% (95% CI=2.05 - 2.77%) as determined by testing 800 pooled samples. Of the pooled samples that tested negative (n=627), none contained any positive individual samples. Of the positive pooled samples (n=173), 146 contained 1 positive sample, 16 contained 2 positive samples, 2 contained 3 positive samples and 9 had 1 indeterminate sample. 8208 ELISA tests were required to determine seroprevalence using individual sera compared to 973 ELISA tests using pooled sera. To identify each individual positive sample within each positive pool, a total of 2906 tests would be required.
Conclusions. For determination of HIV-1 seroprevalence rates in large population-based surveys, testing of pooled samples appears to be cost-effective, practical and highly accurate.

M.G.0.4

A Simple, Rapid, Practical HIV Screening Assay for Developing Country Manufacturing and Use.
DEVELOPING COUNTRY MANUFACTURE AND USE.

Herrick, M., Coulter, M., Schaeffler, Barbara A., Spielberg, F., and Tam, M.R. Program for Appropriate Technology in Health, Seattle, Washington, USA.

Objective: To develop a simple, rapid, inexpensive HIV assay, which can be produced in and used by developing countries. Goals for such a test include a relatively short assay time, reagent stability, equipment independence, and an easily interpretable endpoint.
Methods: HIV gp41 peptide was immobilized onto polystyrene strips, and incubated with neat sera or whole blood. After a wash step, any bound antibody was detected by exposure to protein A-colloidal gold. The total assay time was less than twenty minutes.
Results: Preliminary data was generated using a panel of 110 specimens. The rapid test was positive on 34/34 Western blot-confirmed HIV^+ sera (sensitivity 100%), but detected only 1/77 normal and WB^- sera (specificity 98.7%). A positive result could easily be interpreted by a dark red dot of color on the plastic strip. Although the numbers of specimens at present are small, the test method is also accurate when assayed on samples of whole blood. A cost analysis indicated that the expense of materials is very low (less than US $0.10 per assay).
Conclusions: We have developed an HIV screening assay which appears to be accurate, affordable, and practical. Transfer of this technology for the manufacturing of assay kits in areas proximal to their use will allow many developing countries to extend their screening capability to transfusion centers, primary health care centers, or other areas of urgent need.

M.G.0.5

THE USE OF DILUTION TECHNIQUES IN SCREENING FOR HIV-1 AND 2 ANTIBODIES IN WEST AFRICA.

Hughes,Andrew*;Njie,R.*;Manneh,K.*;Oelman,B.**; Cham,MK.*** and Tedder,RS.****.
*Royal Victoria Hospital,Banjul,The Gambia,**Epidemiology and Statistics Unit,Banjul,The Gambia,***Medical and Health Dept, Banjul,The Gambia,****Middlesex Hospital,London,UK.

Objective. To demonstrate the potential usefulness of a dilution technique in HIV-1 and 2 screening in West Africa.
Methods. Using a combination of 2 'screening' tests (either an ELISA and a particle agglutination test for HIV-1 or 2 different ELISA's for HIV-2) and Western Blotting, tested sera were categorised as either true HIV positives or HIV false positives. These sera were then diluted with HIV negative serum to 1/100 and retested using competitive ELISA's for HIV-1 and 2.
Results. 56 sera considered HIV positive were tested at dilution (5 HIV-1; 51 HIV-2) and 55 remained strongly positive. 59 sera considered to be HIV false positives were tested at dilution (4 HIV-1; 55 HIV-2) and all were found to be negative.
Conclusion. In areas where false positive HIV tests are problematic and where financial and technical resources may be limited, retesting initial ELISA positive sera at dilution may give a reliable indicator of true HIV positivity.

M.G.0.6

POOLING OF SERA TO REDUCE COSTS OF HIV-ANTIBODY SCREENING IN BLOOD BANK DONORS FROM BOGOTA, COLOMBIA, SOUTH AMERICA

Boshell, Jorge*; García Marcela**, Jaramillo Socorro*, Flórez M.V.** and Guzmán M*.

(*) Instituto Nacional de Salud, Avenida Eldorado Carrera 50, Bogotá, Col.
(**)Red Cross National Bank, Bogotá, Colombia.

Objective. Because Colombia is a country with a relatively low prevalence of HIV antibodies among blood donors (0,009%) we saught to determine weather donated blood samples could be pooled and then tested in a simple assay without a loss of sensitivity.

Methods. A single pool consisting of five serum samples was assayed using six different commercially available antibody kits. One HIV-1 positive specimen taken from a group of self-made serum samples with different graded Abbott Recombinant EIA reactivities was included in each pool.

Results. We report on our findings using pools of five specimens and compare them with those from individual specimen screening. We assayed 196 polls of 900 serum samples. From 1% to 30% of pools containing low absorbance values positive specimens were missed.

Conclusion. We discourage the pooling of samples by this procedure in order to reduce costs of HIV-screening among blood donors. The best resultas indicate that 1% or 1.5% of the low-positive reacting sera will be missed, a figure still unacceptable, even in countries where economical resources are badly needed.

Aspects culturels et sociaux de la sexualité
Cultural and Social Perspectives of Sexuality

M.G.0.7 CULTURE, SEX AND SCIENCE: ANTHROPOLOGICAL PERSPECTIVES FOR AIDS PREVENTION AND CARE

de Zalduwondo, Barbara. Harvard School of Public Health, Boston, MA. USA.

The predominance of sexual HIV transmission world-wide has led scientists from diverse disciplines and countries to probe the determinants and measures of sexual attitudes and norms. A scientific approach is crucial, because neither investigators nor subjects are free from bias: Culturally based assumptions and values shape personal sexual behavior, and color representations of and responses to the presumed behavior of others. This paper contrasts anthropological with epidemiological approaches to the scientific study of sexual risk behavior. It highlights theory and methods for mapping and evaluating determinants of sexual conduct in particular sociocultural settings. Determinants include observable realities (e.g., economic, social and health conditions), and unobservable realities such as motivations, emotions, values, self-concept and social meaning, all of which are culturally constructed, systematically interrelated, and which often vary by age, gender and social position.

Moreover, sexual risk-reduction strategies prescribe changes in behavior for medical reasons. That is, they intersect at least two highly-charged and culturally variable domains: those of sexuality and illness. Since AIDS prevention relies upon voluntary changes in behavior, accounting for experience, concepts and meanings in both domains are essential tasks for prevention-relevant research and effective interventions. To exclude such factors in the name of science is unjustified, and it distracts from the real challenges of strengthening culturally-grounded empirical work.

M.G.0.8 CULTURAL, SEXUAL AND SOCIAL PERSPECTIVES OF AIDS IN BRAZIL

Pinel, Arletty*
*Centro de Referência e Treinamento-AIDS. São Paulo. Brazil

Brazil, with 140 million inhabitants and US$ 140 billion in external debt, is a country of contrasts. The State of Sao Paulo (33 million) contributes 41% of the gross national product and boasts a per capita income of US$ 3000. Nevertheless, 1.287.686 families (avge. 4 members) earn less than US$ 60 a month. 18% of the state population is illiterate, 35:1000 is the mortality rate for children under the age of 5, 50% of public elementary school children are malnourished, and the maternal mortality rate is 1:16 for women between the ages of 15 and40. Despite of being a rich state, 39.000 cases of Hansen's disease and 16.000 cases of tuberculosis were notified in 1986. As of 1988, 65.4% of the AIDS cases in the nation were from São Paulo (more than 75% from the city of Sao Paulo). Brazil is the largest Roman Catholic country in the world. However, it has the largest concentration of spiritualism and the city of Sao Paulo is considered the world capital of Pentecostalism. Afro-Brazilian cults are deeply seeded in the culture. Although Brazil gives a touristic image of a sexually permissive country, it is essentially a very conservative one. Sex is still a taboo subject and, even though it may be a source of pleasure, for many it is a way of survival.

M.G.0.9 ADOLESCENT SEXUALITY IN EUROPE

Slikkerveer, L. Institute of Culture and Social studies, University of Leiden, Leiden, The Netherlands.

M.G.0.10 AIDS AND THE SOUTH AFRICAN CULTURE

SABATORNE, MUSA; CHRISTIE, G.

THE AIDS CENTRE, SOUTH AFRICAN INSTITUTE FOR MEDICAL RESEARCH (SAIMR), JOHANNESBURG, SOUTH AFRICA

OBJECTIVE To describe how the South African Culture influences the AIDS epidemic. METHOD An action research methodology was used. Data was collected over a sixteen month period from people seeking services from the AIDS Centre (SAIMR). The multi-cultural population consisted of male and female, adolescents and adults, from major cities and towns throughout South Africa, as well as dependent and independent homelands. RESULTS Two broad aspects of South African culture have been recognised for their influence on AIDS. Firstly, the ideology and practise of apartheid and secondly, that services such as education and counselling are generally imported,decontextualised,non-African and therefore inappropriate for Third World clients. South Africa is a culturally diverse society that requires multicultural rather than monocultural practises. CONCLUSION The apartheid system together with a eurocentric theory of human behaviour severely restricts the control and prevention of AIDS in South Africa. It is incumbent on helping professionals to be aware of the structural determinants of problems, and also to revolutionise the delivery of AIDS services so as to benefit people from a variety of cultural backgrounds.

M.G.0.11 "Sexuality in Africa: The Role of Cultural Beliefs and Behaviour".

By Violet N. Kimani,
Dept. of Community Health,
University of Nairobi. Kenya.

Abstract.

In this paper sexuality is defined according to age and sex of the participants. Sexuality for whom and when?

Examples from a selection of ethnic groups are used to illustrate beliefs and expected behaviour. Population discussed include adolescents in schools, colleges and places of work. Spouse both young and not too young are also included.

The influence of social change as that which is brought about by formal education, christianity and the mass media is considered.

Discussions are centred on the role that a return to traditional beliefs could play to avoid risk behaviour in sexuality.

M.G.0.12 CULTURAL DETERMINANTS OF SEXUALITY IN THE SUDAN

M.G.0.13

KNOWLEDGE ABOUT AIDS IN RURAL UGANDA.

Joseph K. Konde-Lule and E. Rwakaikara, Makerere University, Kampala, Uganda.

Objectives: To assess the degree of awareness about AIDS in the Community so as to design a relevant health education program and to establish a baseline for evaluation.

Methods: A community based survey was conducted in Mpigi District of Uganda. Trained interviewers enrolled 4000 adults from 200 clusters of 20 people each. Each participant responded to a questionnaire in private.

Results: It was found that 5% had never heard about AIDS, 75% knew at least 1 symptom of AIDS and 88% were aware that the infection can be passed on from one person to another. When several possible methods of transmission were proposed, various proportions selected the following: sex 60%, sharing clothes 70%, insects 37%, witchcraft 22% and drinking contaminated water 22%. AIDS is regarded as shameful by 71% but 55% agreed that AIDS victims can be safely nursed at home. Only 62% were aware that AIDS is incurable.

Conclusion: The need for a health education program was ascertained since the general level of knowledge about AIDS was low.

M.G.0.14

AN ASSESSMENT OF AIDS RELATED KNOWLEDGE, ATTITUDES, AND PRACTICES (KAP) IN RAKAI DISTRICT, UGANDA.

Serwadda, David*, Wawer, M.**; Musgrave, S.**; Konde-Lule, J.*; Nduma, J.***; Nasmara, W.****
*Makerere University, Kampala, Uganda, **Columbia University, NY, USA, *** Uganda Virus Research Institute, Entebbe, **** AIDS Control Programme, Entebbe, Uganda.

OBJECTIVE: To assess AIDS related KAP of the generally rural population of Rakai District, a high prevalence area in Uganda.
METHODS: The Ugandan AIDS Control Programme has launched a longitudinal serological and behavioral study in Rakai, which will also assess the effects of AIDS prevention programs. 840 households in 21 randomly selected clusters (9 in trading centers and 12 rural) were censused. The household cohort consists of 3200 persons. For the baseline, consenting persons were interviewed and bled.
RESULTS: Preliminary results show that 69% of the cohort participated in the baseline survey. (9% declined, 24% were absent). 98% of adults knew of AIDS, 93% knew of sexual transmission. 90% indicated that changes in behavior could be protective. 82% stated they had made behavioral changes. Whereas 47% indicated having multiple sexual partners in the last 5 years, only 9% indicated multiple partners for the last year. Condom use was reported by less than 3%. The most common reason given for nonuse was lack of information. On multiple questions, males had 6 to 32% higher correct response rates.
CONCLUSION: A high proportion of the adult population of Rakai has at least some correct information on AIDS, and reports changes in behavior. However, gaps in knowledge exist and KAP results will be considered in designing education programs.

M.G.0.15

IMPACT OF AIDS ON RURAL AND URBAN BEHAVIOUR IN UGANDA

E. Maxine Ankrah, Stephen O. Ouma
Department of Social Work and Social Administration
Makerere University, Kampala, Uganda.

Objective: The WHO intercountry protocols are pretested to develop instruments for a national socio behavioral survey and insights and guidelines for the national AIDS program in Uganda.
Mehtods: A random sample development for the Westing house/Ministry of Health Demographic and Health Survey was adopted to provide the technical and matrix base to execute surveys of three rural and one urban district. WHO KABP and Partner Relations questionnaire were introduced to general populations simultaneously with a third instrument that examined both KABP and Partner Relations and included culturally specific content.
Results: Preliminary pretest finds shown on
a) increased awareness o' AIDS in rural and urban populations:
b) sexual contact along with injections and vertical transmission seen as major forms:
c) new behaviors emerging, including reduction in numbers of sexual partners:
d) little comprehension of etiology of the disease:
e) attitudes toward treatment tend towards punitive measures, especially in rural communities:
f) care giving viewed as personal and family, then governmental responsibility rather than communal:
g) national AIDS control program known to urban populations but with limited impact in rural areas.

Conclusion: A national survey is indicated by the success of the pretest to improve the efficacy of the AIDS Control Program efforts in rural Uganda.

M.G.0.16

KNOWLEDGE AND BEHAVIOR RELATED TO AIDS: A STUDY OF 3500 ZAIRIAN HEALTH WORKERS

Moore, Melinda *,**, Lusakulire N *, Nessig SE *,**,
Bertrand WE *,**, Kashala TD *
* Zaire School of Public Health, Kinshasa, Zaire
** Tulane University, New Orleans, USA

Objective. To describe knowledge and behavior of health workers (HW) in order to target AIDS education programs.
Methods. We surveyed 3462 physicians, nurses, health facility workers, community HW and traditional healers.
Results. A total of 14% in 1987 and 36% in 1988 consider AIDS curable, this increase following announcement of a potential cure; 96% in 1987 and 86% in 1988 considered AIDS preventable ($p<10^{-6}$). A mean of 2.6 (of 4) correct sources of transmission in Zaire were cited spontaneously, and 3.6 were cited with prompting. Also, a mean of 3.6 (of a possible 5) incorrect sources of transmission were affirmed by the respondents, particularly non-medical personnel. Only 57% of the respondents would like to be serotested themselves; physicians were the least interested in being tested (p=.000034).
Conclusions. (1) Most Zairian HW know about AIDS and its transmission, though significant misconceptions persist. (2) The significant drop in those considering AIDS preventable may reflect increasing pessimism among Zairian HWs. (3) These data should be used to plan AIDS educational programs.

M.G.0.17

AN HIV SEROSURVEY IN THE GENERAL POPULATION OF KINSHASA APPEARS FEASIBLE

Kamenga, Munkolenkole*/**; Ryder, R.**/***; N'Galy, B.*; Behets, F.**; Ngoy, T.**; Liambi, A.***; Ngandu, K.****; *National AIDS Program, Kinshasa, Zaire; **Projet SIDA, Kinshasa; ***CDC, Atlanta, GA; ****Ministry of Public Health, Kinshasa.

Objectives. To determine if a large HIV serosurvey of the general population of Kinshasa with pre- and post-test counselling is feasible and to concurrently evaluate the use of maternal blood collected at delivery as a sentinel HIV seroprevalence monitoring system.
Methods. Five of the 24 Kinshasa zones (administrative subdivisions) were randomly selected for a 1988 pilot study of a planned systematic population-based serosurvey of Kinshasa. One "quartier" was randomly chosen from each of the 5 zones. Within the selected "quartiers", one "parcelle" or home unit was randomly selected, and the consenting occupants aged 2 years and more of this and the most adjacent parcelles were invited to participate until a total of 100 individuals were included. During the same period maternal blood samples were obtained from maternities in 4 of the 5 zones.
Results. Of the 86 families visited, 76 (88.4%) agreed to participate. A total of 470 participants (52% females, 48% males aged 2 to 75 years) were enrolled of whom 14 (3.0%) were HIV(+). Twenty-six persons (5.5%) consented to be tested for HIV but did not wish to be informed of their serostatus. The HIV seroprevalence among the 1052 parturients at the 4 maternities was 5.5% compared with an HIV prevalence of 7.5% in the 106 similarly-aged women included in the pilot community survey.
Conclusion. An HIV serosurvey of the general population of Kinshasa with pre- and post-test counselling appears feasible. Such a survey is required to establish a firm baseline for subsequently evaluating the recently established national HIV control and prevention program. The willingness of the majority of the participants to be informed about their serostatus gives a basis for starting a counselling programme for HIV(+) individuals in Kinshasa. Testing maternal blood which can be easily collected may be one way of monitoring HIV prevalence in women of child-bearing age but the validity of this methodology needs to be further evaluated.

M.G.0.18

KNOWLEDGE OF HIV/AIDS AND SEXUAL PRACTICES IN SRI LANKA

Authors: Ateekyn, L.A.*, Weeramunda,J.*, Carballo,M.*, Tawil,O.*
* Department of Sociology, University of Colombo, Sri Lanka.
* Social and Behavioural Research Unit, Global Programme on AIDS, World Health Organization, Geneva, Switzerland.

Objective. To relate the knowledge, attitudes and beliefs (KABP) about HIV/AIDS and other STDs to the sexual orientation and practices among a Sri Lankan sample population with high levels of involvement in sexual tourism, self-reported homosexuality and previous experience of STDs.

Method. In 1988 a multi-stage sample was drawn from the general population of Sri Lanka. A core questionnaire on KABP (WHO model) relating to HIV and other STDs was used. Primary analysis focused on the relationship between the demographic and socioeconomic characteristics and the sexual orientation and behaviour of the respondents.

Results. Whilst some sexual orientations and practices were associated with economic stress (not being employed, low income levels), others were not. There was no significant relationship between sexual orientation and knowledge of the causes and prevention of HIV infection. Consequently, persons with risk behaviour did not show a greater adoption of prophylactic practices than those without self reported risk behaviours.

Conclusion. Much greater effort will be needed to raise the awareness of this population about the unique nature of HIV/AIDS infection vis-à-vis other STDs and the steps that can be taken to ensure protection from HIV.

Infants at Risk: An African Perspective

M.G.0.19 INFANT MORBIDITY & MORTALITY IN UGANDA

E.A.MWOROZI - Dept. of Paediatrics Makerere University,
P.O.Box 7072, Kampala.

OBJECTIVES: To review the causes and rates of infant morbidity & mortality in Uganda from 1983-1988 and to determine the impact of HIV infection on the infant morbidity & mortality rates in Uganda.

METHODS: A review of literature (data) on the causes and rates of infant morbidity and mortality 1983-1988 in Uganda was made with special reference to a study on the HIV impact.

RESULTS :

Year	1983	1984	1985	1986	1987	1988
IMR	110	105	108	140	133	98

The leading causes of infant morbidity & mortality still remain mainly infective and preventable diseases as illustrated in a district mortality survey in 1986—respiratory tract infections (RTI) 18% of all deaths, diarrhoea 15%, malaria 12%, measles 10%. In the follow-up study 12.6% of the infants born of HIV positive mothers died before their first birth day as opposed to only 2% of a comparable group of infants of HIV-ve mothers. The causes of mortality among the HIV positive group were failure to thrive 45%, Diarrhoea 18%, measles 18%, RTI 9%, meningitis 9%. The only infant who died in the control group died of RTI.

CONCLUSION: 1. The causes of morbidity and mortality in Uganda remain the same i.e. preventable & mainly infective diseases. 2. In recent years the IMR in Uganda has generally been declining. 3.HIV infected infants had higher morbidity & mortality rates but overall the HIV infection has not increased the IMR in the country.

M.G.0.20 INFANT MORBIDITY AND MORTALITY IN NAIROBI.

Datta, Pratibha. University of Nairobi, Kenya.

OBJECTIVE: To assess morbidity and mortality in infants of HIV+ mothers.
METHODS: Systematic followup from birth of infants of HIV+ (study) and HIV- (control) mothers.
RESULTS: One hundred and fifty-five study infants and 253 controls have been follwed for a mean of 10 (range 0.5 to 30) months. Study infants had more episodes (per 100 infant months of followup) of febrile illnesses (18 vs 13,p=.01), diarrhoea (10 vs 8, p=.04), cough(28 vs 23,p=.025), pneumonia (3 vs 1.6, p=.01), and otitis media (1.8 vs .6, p=.001).Failure to thrive(FTT) occured in 31/155(20%) study infants versus 27/253(11%) controls (p=.01,RR=2, 95%CI=1.2-3.8). Measles developed prior to immunization in 7/70(10%) study infants and 1/101(1%) control (p=.01,RR=11, 95%CI=1.3-81), and despite vaccination in 1 of 61 study and 2 of 98 control infants. 2 infants from each group had chickenpox. Infant mortality (IM) was higher in the study group:12/155 (7.7%) vs 6/253(2.4%),p=.01. Infants of HIV+ mothers with more advandeced HIV disease or subsequent death had higher IM, FTT and OM than infants with asymptomatic mothers.
CONCLUSION: Infants of HIV+ mothers have repeated and severe childhood illness leading to FTT or death. Infants of HIV+ symptomatic mothers are at greater risk of dying, FTT or frequent illness.

M.G.0.21 RISK FACTORS FOR MATERNAL-INFANT TRANSMISSION IN ZAIRE

Ryder, Robert W. Projet SIDA, Kinshasa, Zaire

M.G.0.22 BREAST MILK AS A RISK FACTOR FOR HIV-1 TRANSMISSION.

Hira, Subhash
University Teaching Hospital, Lusaka, Zambia.

HIV-1 may be transmitted from an infected mother to her fetus during pregnancy or childbirth or immediate post-partum period. Although virus isolation from cell-free breast milk has been documented, the contribution of breast feeding in latter modality of transmission of HIV-1 has been questioned. There are, however, at least 8 case reports of HIV-1 seronegative women at the time of delivery, who during immediate post-partum period (usually through receipt of HIV-1 infected blood transfusion or drug abuse) got infected. These mothers and their breast-fed children seroconverted. While other routes of transmission could not be excluded in some cases, it was suggested that children were infected through breast milk. In Lusaka, we prospectively followed 16 maternal incident cases and their children for 2 years (mothers and children were p24 and antibodies negative at labor). Mothers acquired HIV-1 through heterosexual route. Subsequently, 3 mothers infected their children who seroconverted at 18, 20,and 22 months of age, respectively. No risk factcrs other than breast milk were identified.
Conclusion. The sequential seroconversion of mothers and children is suggestive of possible transmission of the virus through breast milk. Since advantages of breast feeding outweigh the possible risk of HIV-1 transmission, breast feeding may not be discouraged till more information is available.

M.G.0.23 SAFETY AND EFFICACY OF IMMUNIZATIONS WITH LIVE VACCINES.

Embree, Joanne. University of Manitoba, Winnipeg, Canada.

Objective. To review the safety and efficacy of live oral and bacterial vaccines given to children of HIV+ mothers.
Methods. Review of vaccination complications following BCG, oral polio vaccine (OPV) and measles vaccine used in the perinatal HIV transmission study in Kenya.
Results. BCG: Although 6 HIV-infected infants have been reported with respiratory disease and/or lymphadenitis following BCG vaccination, neither have occurred in 120 infants of HIV+ mothers given BCG in this study. Failure to respond to PPD testing occurred in 28/40 (70%) study vs 28/62 (45%) control infants (p=0.02; OR=2.83; 95%CI=1.13-7.19). OPV: Polio did not develop in either infant or family members following administration to 137 infants of HIV+ mothers. Short and long term anti-polio antibody testing is not yet completed. Measles: 61 infants of HIV+ mothers have received measles vaccine without sequelae; 7/8 had protective antibody production vs 10/15 controls tested to date. Measles developed in 7/70 (10%) study infants vs 1/101 (1%) controls (p=0.008; OR=11.1; 95%CI=1.3-81.0) prior to vaccination. One of 61 study and 2/98 control infants developed measles despite vaccination.
Conclusion. Complications of live vaccines are rare in infants of HIV+ mothers. Continued BCG use should be reserved for areas of high tuberculosis risk. In developing countries, OPV is not contraindicated. Significant HIV presence in an area may hamper existing control measures. A more efficacious measles vaccine which can be safely given to infants prior to 9 months of age is needed.

M.G.0.25 THE WAVE-LIKE PROGRESSION OF AIDS IN THE DOMINICAN REPUBLIC

Garris, Ivelisse; De Moya, E.A.; Guerrero, E; Peña, C; Domínguez, L; Belliard, M.
PROCETS, Ministry of Public Health, Santo Domingo, Dominican Republic.

Objective. To describe and analyze the progression of the AIDS epidemic by sex, age, risk factor, occupation and geographical distribution from 1983 to January 1989 in the Dominican Republic.

Methods. Analysis of national AIDS epidemiological surveillance data broken-down by relevant variables. Growth rates by semester are calculated. Changes in male: female ratios and their implications are analyzed.

Results. As of January 1989, 855 AIDS cases have been notified to PROCETS. Despite the sustained increase in cases from 1983 to January 1989, the growth rates curve by semester has already described two complete waves with periods of high and low acceleration. Introduction of the virus to new population groups and high infectivity of cases in the acute phase seem to be responsible for this trend. Male: female ratios have varied from 9.0 (1983-84) to 3.6:1 (1985-86) and 2.2:1 (1987-88).

Conclusion. The wave-like progression of AIDS in the Dominican Republic - suggests that a high transmissibility of HIV infection occurs shortly after the introduction of the virus to new population groups.

M.G.0.26 TREND ANALYSIS OF AIDS CASES REPORTED IN BRAZIL, 1982-1988

Chequer, Pedro*; Rodrigues, L.*; Castilho, E.*; Bergamaschi, D*.
*Ministry of Health, National Division of STD/AIDS, Brasília, Brazil. ** Oswaldo Cruz Foundation/Ministry of Health, Rio de Janeiro, Brazil

Objective. To describe temporal and geographical trends for AIDS patients, as well as risk factors and related disease for AIDS cases, reported to the National Surveillance System of Brazil, from 1982 to December/1988.

Methods. Cases reported on a routine basis to the Ministry of Health were evaluated in terms of rates, ratios and proportions over time.

Results. The overall AIDS incidence rate increased from 0.05 in 1982 to 14.00 per million population, in 1988. The proportion of cases reported from the cities of Rio de Janeiro and São Paulo, in 1984, decreased from 83% to 49%, in 1988. In 1988, 43% of the reported cases came from other cities than the five biggest metropolitan areas. The male/female ratio changed from 30:1 in 1985 to 8:1 considering the cases reported in 1988. Seventy nine percent of the cases reported from 1982 to 1985 were classified as having a high level of education. In 1988, this rate was only 33%. The proportion of AIDS cases aged 30 - 44 years decreased from 55% in 1985 to 48% in 1988. The first 8 pediatric cases occurred in 1984, and in 1988 they represent 4% of the total reported cases. In 1985, 7% of the pediatric patients were infected by perinatal transmission, however, this proportion reached 45% in 1988. The proportion of homo/bisexual AIDS cases decreased from 79% in 1985 to 55% in 1986. Among IVDU(s), the male/female ratio changed from 5:1 in 1986 to 3:1 in 1988. The proportion of recipients of blood/haemophiliacs which was considerably high in 1986, despite its decreasing (7% in 1988) still remains above the observed rate in Western countries. The proportion of IVDU(s) which was 1% in the span of time between 1982 and 1985, increased to 11% during 1986 to 1988.

As far as associated diseases are concerned, it was observed that the relative frequency of Candidiasis remained constant over time. The proportion of Tuberculosis increased from 8% (1982-1984), considering the first 150 cases, to 22% in 1988, and Kaposi's Sarcoma decreased from 23% in 1984 to 9% in 1988.

Conclusions. During the six years of the epidemic of AIDS in Brazil, some very important changes occurred over time. The proportion of IVDU(s) AIDS cases, the proportion of female patients as well as perinatal transmission cases, of heterosexual patients and Tuberculosis as an opportunistic disease, are increasing. On the other hand there is a slight decrease in the proportion of haemophiliacs/recipients of blood and components AIDS cases although it remains above the rate observed in Western countries.

M.G.0.27 HIV EPIDEMIOLOGICAL PATTERNS AND TRENDS IN MEXICO: AN UP-DATE

Valdespino JL*, Sepúlveda J*, Izazola JA*, García L*, Palacios M*, Bravo E*
*Dirección General de Epidemiología, Ministry of Health. Mexico

Objective: To up-date the characteristics of the HIV-1 epidemic pattern and its future trends in Mexico.

Methods: An analysis of AIDS cases, serosurveys, trends of cases by category of transmission, estimation of infected people and projection of cases.

Results: Mexico occupies the fourth place in number of AIDS cases in America with 2,013 cases (up to January, 1989). The men/women rate is 9 to 1, with a more accelerated trend in women. 3.7% of cases occur in children. In male adults, cases are distributed as follows: 54% homosexuals, 27% bisexuals and 12% heterosexuals, with an accelerated growth in heterosexual transmission. In women, 69% of cases are through blood transfusion and 31% due to heterosexual contacts. The cases in IVD users is less than 0.4%. The sentinel seroepidemiological surveys show the following prevalence: homosexual and bisexual males: 3% to 35%; users of HIV detection centers : 7.8% (men) 0-3.5% (women); haemophiliacs: 33% - 66%; female prostitutes: 1-35%; male prostitutes: 5-16%; voluntary blood donors: <0.1%. The estimations of HIV-1 infected ranges from 31,600 to 97,700 for 85 million inhabitants. The growth of cases continues to be exponential; nevertheless, a decrease has been observed in the growth of cases particularly in homosexual men in urban areas; however, the number of expected cases for the next five years is more than 20,000 cases.

Conclusions: The epidemiological patterns of HIV-1 in Mexico shows similar characteristics to Latinamerican countries where transmission through bisexual men and blood transfusion is creating a rapid growth of heterosexual transmission. This pattern has intermediate characteristics between occidental and African patterns.

M.G.0.28 HIV INFECTION IN ECUADOR

Ringenberg, Roy*; Merino, M.L.**; Leoro, G**; Jurado, M.*; Racines A.*; Rumbea, J.* and Weilbauer, F**.
*Ministry of Public Health, Quito, Ecuador, **Red Cross, Quito, Ecuador.

Objective. To determine the prevalence of HIV infection in Ecuador.

Methods. Survey of various groups with low- and high-risk behaviors using ELISA and microELISA with confirmation by Western Blot.

Results.

Group	City	Test date	Total patients	Positive on ELISA	Positive on W.Blot
Homosexuals	Quito	11/88	14	6 (43%)	4 (29%)
	Esmeraldas	4/88	20	0	-
Female sexual partners of one male AIDS pt	Quito	1986	16	2 (12.5%)	1 (6.2%)
Prostitutes	Sto.Domingo	1987	105	5 (4.8%)	0
	Esmeraldas	4/88	64	1 (1.6%)	(damaged)
	Quinindé	4/88	100	0	-
Prisoners	Quito	2/88	662	0	-
	Esmeraldas	4/88	422	0	-
Volunteer(Low-risk): military cadets	Quito	1987	487	0	-
Voluntary blood donors:					
Red Cross	Quito	1987	16,978	52 (0.3%)	0
other blood banks	Quito	1987	955	2 (0.2%)	0
Red Cross	Quito	1988	17,884	9 (0.05%)	0
other blood banks	Quito	1988	1,429	2 (0.1%)	0

Conclusion. Ecuador presents a distinct epidemiologic picture, with extremely few infected persons among those with no high-risk behavior, and a high percentage infected in at least one group of homosexuals.

M.G.0.29 HIV-INFECTION IN VOLUNTARY BLOOD DONORS IN ARGENTINA

Fay,Oscar*;Muchinik,G**;Rey,J***;Sileoni,S****;Koffmann, D*****;Gatti,H*
*Universidad Nacional de Rosario,Rosario,**IIHEMA,Academia Nacional de Medicina,***Hospital de Clínicas,Universidad de Buenos Aires,Buenos Aires,****Facultad de Ciencias Médicas,Universidad Nacional de Córdoba,Córdoba,*****Hospital Juan A.Fernández,Buenos Aires,Argentina.

Objective. A multicentric study to estimate the prevalence of HIV antibody (Ab) in blood donations countrywide.

Methods. A total of 111,641 blood units was tested for HIV-1 Ab as from 1986 in 4 different centers in the country; 94,189 were tested using Abbott EIA and 17,452 (Córdoba) units, with ENI and Organon EIA. W.B.(Dupont,Sorin), IF and ENV/CORE (Abbott) were used as confirmatory methods.

Results

City	1986 stu./Pos	% +	1987 stu./Pos	% +	1988 stu./Pos	% +	Total stu./Pos	% +
Buenos Aires 1	1651/3	.18	7250/3	.04	8450/20	.24	17351/26	.14
Buenos Aires 2			3594/5	.14	7058/19	.26	10652/24	.22
Rosario	3546/1	.03	14960/10	.07	47680/87	.18	66186/98	.14
Córdoba			8992/2	.02	8460/5	.06	17452/7	.04
Total	5197/4	.07	34796/20	.06	71648/131	.18	111641/115	.13

Conclusion. The prevalence of HIV+ donors has increased since 1987 countrywide. The percentage of positive samples has increased about 300% in the 1987-1988 period. We found different prevalence in the HIV+ percentage in different areas of the country.

M.G.0.30 A CRITIQUE OF THE CUMULATIVE RATE OF AIDS IN THE CARIBBEAN

Courtenay Bartholomew*, F. Cleghorn**, P. Imperato***
*The University of the West Indies, Port of Spain, Trinidad
** The Caribbean Epidemiology Centre, Port of Spain, Trinidad
***State University of New York Health Science Centre, Brooklyn, U.S.A.

Worldwide statistics of the cumulative rate of AIDS per 100,000 population show that certain English speaking Caribbean islands have the highest rates and giving the impression that the epidemic is more prevalent in the Caribbean Basin. Whereas, for example, up to June 1988 the cumulative rate in the U.S. was 26 per 100,000, Bermuda (pop 59,400) had a cumulative rate of 126, the Bahamas (pop 235,000) 91, Trinidad and Tobago (pop 1.2 million) 25 and Barbados (pop 256,000) 24. Analysis of these figures do not take into account the fact that a large percentage of these populations reside in urban areas and in Trinidad, for example, out of 310 cases of AIDS up to June 1988, 242 were reported from the capital city of Port of Spain and its suburban areas with a population of 404,800 (cum. rate 60/100,000). In the much larger area of the rest of the island with just over half of the population (627,600) there were only 68 cases (cum. rate 10.8/100,000). On the other hand, in New York City with a population of 7 million, more than the total population of the English speaking Caribbean (6 million), there were 14,296 cases (204.2/100,000) as opposed to the total number of cases in the English speaking Caribbean islands - 822 (cum.rate 13.6/100,000). Moreover, in the U.S. (pop 240 million) over one third of the cases of AIDS are reported from the States of New York and San Fransisco (pop 44 million) and as opposed to these small islands there is a significantly larger population outside of these two states with, as yet, little viral incursion. This may be termed the "dilution factor". Further examples from the Caribbean will be cited to demonstrate this point.

CASE STUDY: SOCIAL ECONOMIC IMPACT OF AIDS IN A HOME

ELIZABETH N. NGUGI
UNIVERSITY OF NAIROBI, DEPT. OF COMMUNITY HEALTH

In July 1987 a young man in his early twenties went abroad for higher learning. He had been tested for HIV antibodies before departure and found negative. Ten months later he came back with AIDS and was hosptalized, improved and discharged home. Parent (mother) took compassionate leave to care for him. This presentation sets to show the changes the family had to make and how they coped with effects of the young man in that community.

The young man stayed at home for about a month where I visited him twice a week. Counselling was seen as an element of support. He was then readmitted and died a week after admission.

This case study would have been impossible without kind permission and inherent co-operation from the parent (names and photographs withheld on request).

M.G.0.33

The Impact of HIV on the Laboratory in Developing Countries

John Shao - Muhimbili Medical Centre, Dar es Salaam, Tanzania

Most blood tests currently available in the markets for AIDS screening in the laboratory measure antibiodies against human immunodeficiency virus (HIV). There are no tests so far developed that are one hundred percent perfect. Under ideal laboratory conditions both ELISA and Western blot are capable of achieving greater than 99% sensitivity and specificity. Screening of blood samples in Africa have caused problems concerning false and negative results. Besides there is a burning issue of stability of testing materials under difficult conditions. Further more the tests must be easy to perform and read without high and expensive technology unaffordable by mostlaboratories in developing countries. There is an urgent need to evaluate the performance of tests in field conditions.

T.G.0.3

CONSIDERATIONS FOR RETROVIRAL SERODIAGNOSIS
Kanki, Phyllis; Harvard School of Public Health,
Boston, Massachusetts, USA

The development of a cost-effective retroviral serodiagnosis program is dependent on a number of different factors. The major purpose or setting for serodiagnosis, such as clinical setting, population surveillance or blood banks, for example, may significantly alter how retroviral testing algorithms may be developed. In the absence of highly sensitive and specific tests that are cost-effective for developing countries, setting-specific serodiagnostic algorithms will be the most cost-effective. In addition, consideration of projected seroprevalence for a given retrovirus may be a determinant in whether single or multiple retroviruses should be tested for. Finally, field evaluation of various methodologies on representative samples from these various settings should be a prerequisite to establishment of a given serodiagnosis program.

T.G.0.4

SITUATION DE HIV1 ET DE HIV2 EN AFRIQUE DE L'OUEST ET SES CONSEQUENCES SUR LES COUTS DE DEPISTAGE.

Sankalé Jean-Louis, Mboup S., et Convention interuniversitaire (Dakar-Tours-Limoges-Boston)

Objectif : Montrer que la situation épidémiologique particulière de l'Afrique de l'Ouest impose des contraintes dans le dépistage des HIV.
Méthodes : Décrire à partir des données de la littérature l'épidémiologie des HIV en Afrique de l'Ouest, caractérisée par une circulation simultanée de HIV1 et de HIV2 avec dans la plupart des pays une prédominance du HIV2 ; et tirer les conclusions quant aux coûts de dépistage engendrés par cette situation
Résultats : Les taux de prévalence en Afrique de l'Ouest sont hétérogènes

	Population étudiée	HIV2(%)	HIV1(%)	HIV1+HIV2(%)
Sénégal	Donneurs de sang	0,57	0,02	0
	Prostituées	15,80	0,79	0,33
Bissau	Donneurs de sang	8,4	0	0
	Prostituées	46,6	0	0
Ouagadougou	Prostituées	2,4	15,4	3,2
Cotonou	Prostituées	3,7	4,5	0

Le HIV2 apparaît nettement endémique en Afrique de l'Ouest alors qu'il semble se répandre sur un mode épidémique au reste du continent. Par contre le HIV1 connaît une situation opposée. Cependant les deux virus sont retrouvés en des proportions variables dans tous les pays de la sous-région. Il faut noter qu'il existe des zones "tampons" entre les deux grandes zones de prédominance de HIV1 et de HIV2, où l'on rencontre dans des proportions semblables les deux virus.
Conclusion : Cette situation rend absolument nécessaire dans tous les pays de l'Afrique de l'Ouest, mais aussi dans les pays avoisinants et les pays connaissant une situation épidémiologique semblable, le dépistage simultané des deux virus. Ceci entraîne des coûts supplémentaires (en réactifs, en temps, en personnel, etc) qui peuvent être partiellement réduits en utilisant des tests combinés qui détectent les deux virus

T.G.0.5

HIV-TESTING CRITERIA FOR AFRICA.

Hampl, Hartmut. Department Research and Development;
Abbott Laboratories Europe, Max-Planck-Ring 2,
6200 Wiesbaden-Delkenheim, West-Germany.

Testing for HIV-infections must mean nowadays testing for HIV-1 as well as for HIV-2. The possibilities for identification of infected individuals has increased since the first test was approved in early 1985. It seems advantageous to centralize as much as possible the screening for HIV, and even more important to establish one reference laboratory for confirmatory testing in each country.

Confirmatory test systems as well as screening assays need to be specially looked at with respect to its applications in Africa. The different formats of screening assays like Enzyme Immunoassay (EIA), Haemagglutinationtests, Self-performing quick tests (Testpack, Dipstick-tests) and their potential for being used in Africa will be presented. A comparison of the different test formats is done with respect to equipment required, test performance, time to result and need for training.

In summary it seems to be important to find a way of testing for HIV in Africa that may be different from that in Europe but meets the needs of this continent in order to prevent a further dramatic spread of HIV-infections.

SOME CORRELATES OF PERCEIVED VULNERABILITY TO HIV INFECTION IN SRI LANKA

Authors: Carballo,M.°, Nahrver,AK.°, Tawil,O.°, Weeramunda,J.*
* Department of Sociology, University of Colombo, Sri Lanka.
° Social and Behavioural Research Unit, Global Programme on AIDS, World Health Organization, Geneva, Switzerland.

Objective. To investigate factors of potential bearing on perceived vulnerability to HIV infection by providing an answer to the following question: what are the socio-demographic, knowledge, attitude and practice variables that differentiate the minority of respondents who regard themselves as highly likely to get AIDS from those who do not?

thod. Using the data obtained through a large-scale KABP survey in Sri Lanka, some 13 per cent of respondents were found to be concerned about their personal vulnerability to HIV infection. These were compared with those respondents who, despite some knowledge about AIDS, did not consider themselves as particularly at risk. The two groups were compared on a number of socio-demographic (age, sex, residential status, religion, education, marital status) and AIDS-related knowledge, attitudes, beliefs and practices.

Results. Of the large number of variables considered only a few indicated statistically significant differences between the two groups. While some of the observed differences are in the expected direction, many others are not. Thus, perceived personal vulnerability seems to be only partially related to such objective measures of risk exposure as age, sex, residential status and sexual activity.

Conclusion. These findings should be taken into account in developing IEC campaigns on AIDS

T.G.0.8

THE CHALLENGE OF MODIFYING RISKY PRACTICES IN WELL INFORMED GAY MEN.

Izazola Antonio*, Sepulveda J*, Valdespino JL*, Ramah M**, Ramos M*
*Directorate of Epidemiology, Ministry of Health, Mexico, **AIDSCOM, Washington, USA

Objective: To describe the process of production of graphic educational material, and its possible impact for the promotion of condom use in gay and bisexual men with a high level of knowledge about AIDS in Mexico. Method: With knowledge, attitudes and practices data about AIDS and its preventive measures in gay and bisexual men from Guadalajara City, Mexico (Set. '87 and May '88), a sociodemographic and educative needs profiles were done. Different concepts were tested through focus groups in this population. With the chosen concepts, 2 posters, 2 condom wallets and 1 comic were done and distributed in july '88, in centers where gay men meet (discos, bars, etc) by staff members with the collaboration of gay community. Another survey was carried out after the distribution of this material in August. The mesages included in the condom wallet are that AIDS is an STD, promotion and erotization of condom and addresses of reference centers. These messages were directed towards two different practices: 1) to causal contacts and 2) to stable couples, according to the selected designs. Results: Since the first survey, an appropriate level of knowledge of the principal variables was higher than 90%; messages of knowledge were not included, although there are still some myths about transmission. The prevalence of condom use was increased secularly, where it is noted that the change is higher between the second and third survey when controlled by having received this graphic material:

Prevalence of condom use 1987 - 1988

	Set 87	May 88	Aug 88	p
Last month	29	49	41	<0.01
Last 4 months	38	49	62	<0.001

Condom use by reception of material

	saw	not saw	p	OR
Last month	43%	22%	<0.01	2.7(1.3,6.0)
Last four months	64%	55%	NS	1.4(0.8,2.9)
Last intercouse	32%	16%	0.02	2.8(1.2,6.7)

Conclusion: It is particularly complex the design of educational material for well informed groups with adequate attitudes towards prevention but with high prevalence of risk practices. The challenge in gay and bisexual men is exactly the case. Perhaps the only way to modify high risk practices is with the combination of the design of focused educational material with adequate channels of distribution.

T.G.0.9

MASSIVE CAMPAIGN FOR AIDS EDUCATION, ACHIEVEMENTS AND PROBLEMS

Sepúlveda Jaime*, Izazola JA*, Valdespino JL*, Mondragón M*, Townsend J.**
*Directorate of Epidemiology, Ministry of Health, MEXICO.
**Population Council

Objective: To describe the principal achievements and problems of the mass media AIDS prevention campaign.

Method: The educational campaign through mass media in Mexico began in April 1987. In September, 1987 and May, 1988, surveys to determine the knowledge about AIDS in general population were carried out in 6 cities in Mexico. Simultaneously, an analysis of press contents was undertaken.

Results: The first and second surveys showed 91% and 95% identification of sexual transmission mechanisms (tm), 90% and 94% identified blood tm, and 86% and 89% perinatal tm. 72% and 73% identified AIDS as a disease to which everybody is susceptible; 81% and 80% identified it as an infectious disease and 73% and 80% identified AIDS as preventable. Myths about transmission are still frequent, although there is a descendent trend; e.g. 39% and 31% think HIV can be transmitted through casual contact. Condom use was stable, 29% and 32% referred having ever used a condom. The knowledge of AIDS prevention through the use of condoms increased from 61% to 77%.

Critiques arising from different groups condemned the use of the word "condom" believing that the "promotion of condom would increase sexual freedom, promiscuity, prostitution and male homosexuality". Some other groups requested that the campaign "should be more aggressive" in their contents. This discussion, however, positioned the condom on the top of people's mind.

Conclusion.- Mass media campaigns directed to general population, do not modify practices (nor risky nor preventive); however, they are useful to create proper perception of the magnitude of AIDS and decrease myths and stigmatization . These campaigns may influence decision-makers to support programs for AIDS prevention.

T.G.0.10

AN INTERNATIONALLY ADAPTABLE AIDS PREVENTION PROGRAM FOR YOUTH

Arnold, Wendy*; Mantion, S.**; Velly, R.**: and Renaud, L.***
*Adolescent Alliance, Los Angeles, CA. USA. **Association Jeunes" Contre le SIDA (AJCS), Paris, France, *** Association des Artistes Contre le SIDA, Paris, France.

Objective: To set up a volunteer-based AIDS education program where trained young people speak directly to their peers in academic settings about AIDS transmission and prevention. Methods: Adolescents and young adults are recruited through announcements on national television shows and publications targeting the youth. After an intense training on basic AIDS information and communication skills, the young speakers lead small group discussions with comparably aged youth. The issues of how HIV is transmitted and how to protect oneself from HIV exposure are emphasized. All AIDS-related concerns are addressed. Results: With the use of video films and AIDS informational brochures targeting teenagers and parents, thousands of junior and senior high school students in France have shown an increase in AIDS knowledge and prevention as evaluated by a pre/post-test questionnaire. Parents have an active role in the educational program as well. Conclusions: The AJCS program, adapted from the Adolescent Alliance Peer Education Program in the USA, is culturally sensitive to the needs and AIDS-associated concerns of youth in France and can be applied to other countries in the world. The international model is inexpensive and easy to implement and evaluate.

T.G.0.11

ADOPTION OF SAFER SEXUAL BEHAVIOUR BY AN HIV HIGH RISK GROUP OF BAR AND RESTAURANT WORKERS IN DAR ES SALAAM, TANZANIA

Fred Mhalu*, Hokin C,** Sange P,** Shao J,* Bredberg Raden U.*** Biberfeld G*** et al
*Muhimbili Medical Centre, Dar es Salaam, Tanzania, **Dar es Salaam City Council, Dar es Salaam, Tanzania, National Bacteriology Laboratory, Stockholm, Sweden.

Objective: To study the adoption of safer sexual behaviour by a group of bar and restaurant workers at high risk of HIV infection in Dar es Salaam, Tanzania.

Methods: After recognising the rapid rise in HIV infection among restaurant and bar workers in Dar es Salaam where the prevalence rates among female workers increased from 29.0% in 1986 to 42.4% in 1988 (prevalences in males were 8% in 1986 and 9.1% in 1988) efforts were made to impart health education, individualised counselling and free provision of condoms to the group.

Results: 398 workers (156 male and 242 females) out of 617 (249 male, 368 females) originally enrolled in the study were available for followup after 3 months. 26(6.6%) of the workers had not adopted any sexual behaviour change due to the threat of AIDS, 191(48.5%) had had only one sex partner, 13(3.3%) had stopped having sex, 42(10.7%) were using condoms all the time and 122(30.9%) had reduced the frequency of changing sex partners. The prevalence of utilisation of condoms increased from 19.1% to 67.1% during the 3 months of followup. 243(63.4%) of the workers considered a supply of 3 condoms per week to be adequate, 96(25.1%) required no condoms at all while 44(11.5%) required 12 condoms per week.

Conclusion: Intensive health education and counselling with provision of condoms have a good chance of success in reducing the rapid spread of HIV infection among groups of individuals engaging in high risk sexual behaviour in developing countries.

THEORY AND PRACTICE IN PROCUREMENT OF SAFE BLOOD IN KAMPALA, UGANDA.

Watson-Williams, E.J., Kataaha, P., Coutinho, S., and Ssenyonga, P.
Nakasero Blood Bank, Ministry of Health, Uganda.

Objective. For the past two years, it has been policy to screen all donated blood for anti-HIV before transfusion. In November 1988, the Ministry of Health and European Development Fund joint project of an all volunteer blood bank in Kampala started operation.

Methods. Prospective donors get information, both verbal and written, concerning the transmission of HIV-1. Blood is given anonymously, but one week later the donor can use a code to request the test results. Each sample is tested by a first generation EIA method (Vironostika, Organon). Positives are confirmed by a competitive inhibition EIA (Uniform Anti-HIV-1, Organon). Negative sera are retested by EIA using synthetic peptides as antigen (Biochrom. Inc.). Donors with confirmed positive tests have a second sample checked before getting a definitive result.

Results. During the first three months we have found: 1. Positive results in 9% of donors. 2. Donors informed of positive results, with accurate information and sensitive counseling, made appropriate behaviour decisions. 3. Some donated blood solely to obtain an HIV-1 antibody test.

Conclusion. The implications for blood bank policy in Uganda will be discussed.

COUNSELLING & EDUCATION IN THE TOWNSHIPS

ALFRED S MACHELA: *A Myeki** T Payne ***Rifilue
TOWNSHIP AIDS PROJECT (SOWETO)

OBJECTIVE: To develop an ongoing Comprehensive Progreve Primary health care programme for (a@ H.IV infection and other sexually trasmitted diseases in the Townships.
(b) Develop an HIV counselling programme (Pre, post.test and support group counselling, with trained educators for the community.
METHODS: Organising workshops, house meetings and using educational pamphlets which are relevent to a person living in a township and involving clinical and non clinical person who have credibility in their area and trusfed by the people.
RESULTS: Due to the fact, that the project involves people from the townships, education and the usage of contraseptives has not been a problem, determing people's level of understanding of Aids, Clarifying the Myths surrounding Aids.
CONCLUSION: Informal group sessions, individualised counselling and explanation of the condition and its transmission. Frank discussions about safer sex and care must be taken not to scare people and problems with measures taken by the state.

T.G.0.15

AIDS MESSAGES AND HELP TO WOMEN IN THE THAI SEX INDUSTRY

Apisook, Chantawipa. Bangkok, Thailand.

T.G.0.16

COUNSELLING IN MEXICO CITY

Rosalina Plascencia, CONASIDA, Mexico City, Mexico.

Objective. The main object is to corroborate the great importance of counselling when working with patients in high risk practices.

Method. Using the open interview technique we can obtain relevant information on high risk practices, while at the same time taking into account the affective dimension—and the guilt—involved in a possible positive test.

Results. One of the benefits of counselling is that it brings the client to decide to take the test, and prepares her/him to handle the anguish and confront the results, whatever they may be. In subsequent interviews, we observed a change in sexual conduct and in relationships with partners, which we link to the information given through counselling and psychological support.

Discussion. Our recommendation to persons wanting to undergo the detection test is to contact a counsellor who will then evaluate the problem before entering into the process.

PROGRESSIVE INCREASE IN HIV-1 SEROPREVALENCE IN PREGNANT HAITIAN WOMEN: 1986 THROUGH 1988

Boulos, Reginald*, Halsey, N**, Holt, E**, Quinn, T**, Ruff, A**, Brutus, JR*, et al
*Centers for Health and Development, Port-au-Prince, Haiti;
**Johns Hopkins University, Baltimore, MD, USA

Objective. To determine changes in HIV-1 seroprevalence in pregnant Haitian women residing in a periurban slum.
Methods. Sera from pregnant women attending prenatal clinics in a periurban slum were screened by HIV-1 ELISA and confirmed by WB. Prior studies have demonstrated that heterosexual contact is the predominant mode of transmission.
Results.

	1986	1987	1988	Total
Number Screened	1245	2009	1074	4328
% HIV-1 Positive	8.8%	9.9%	10.5%	9.7%

Increases were most notable in the 20 to 34 year age groups. 1988 seroprevalence by age: 14-19 yrs (5.9%), 20-24 yrs (13.5%), 25-29 yrs (11.3%), 30-34 yrs (9.1%), 35-39 yrs (4.0%), 40+ yrs (5.3%). The highest prevalence rate (16.7%) in 1988 was in women in their third pregnancy, but 6% or more of women pregnant for the first time were HIV-1 seropositive each year.
Conclusions. Many women are becoming infected soon after becoming sexually active and transmission rates remain high. A control program is urgently needed.

T.G.0.20

HIV-1 IN HOSPITALIZED HAITIAN PEDIATRIC AND ADULT PATIENTS

Adrien, Mario*; Boulos, R*; Louis, A*; Joseph, F*; Kissinger, P*; Halsey, N**, et al.
*Centers for Health and Development, Port-au-Prince, Haiti,
**Johns Hopkins University, Baltimore, MD, USA.

Objective. To determine the HIV-1 seropositivity rate and related symptoms of hospitalized patients in an urban primary care hospital.
Methods. All patients admitted to the general pediatric and adult wards were screened anonymously for HIV-1.
Results. Of 117 adult admissions, 27(23%) were HIV-1 seropositive. Of 372 pediatric admissions, 44(11.8%) had HIV-1 antibodies in their sera and 45(13.5%) of 333 of their mothers were HIV-1 seropositive. Although higher rates of HIV-1 seropositivity were observed in children with gastroenteritis (12.2%), weight loss (12.9%), and/or rash (18.2%), significant ($p<0.05$) associations with HIV-1 seropositivity were observed only with cough and pneumonia (29.2%). Since 71% of the children were < 1 year of age, the presence of maternal antibodies could not be ruled out. Two HIV-1 seropositive children 11 and 13 years of age who had not had transfusions were identified.
Conclusions. A high percentage of pediatric and adult patients requiring hospitalization in this population are infected with HIV-1 or have a mother with HIV-1 infection. Pneumonia may be a predictor of HIV-1 seropositivity.

T.G.0.21

PREVALENCE OF HIV-1 AND HTLV-1 IN GONAIVES, HAITI

Boulos, Reginald*; Bonhomme, M.**; Quinn, T.***; Fortney, J.**; Labrun F.*; Halsey, N.***; et al.
Centre pour le Developpement et la Sante, Port-au-Prince, Haiti **Family Health International, Research Triangle Park, NC, USA *** Johns Hopkins University, Baltimore, MD, USA

Objective. To determine the prevalence of HIV-1 and HTLV-1 infection in a semi-urban area outside of Port-au-Prince.
Methods. Between April and November 1988 a total of 1865 men and women aged 15-45 obtaining medical services at two health centers in Gonaives, Haiti, were recruited to participate in this study. Serum specimens were collected from each participant and information on demographic characteristics and selected risk factors for HIV-1 and HTLV-1 infection was obtained using a brief structured questionnaire. Serum specimens were tested for antibody to HIV-1 and HTLV-1 by ELISA, and repeatedly positive samples were confirmed by Western blot.
Results. Preliminary results indicate the prevalence of Western blot confirmed HIV-1 antibody to be 9%. Additional results on the prevalence of HTLV-1 infection and on the prevalence of co-infection will be presented.
Conclusions. Few seroprevalence studies have been conducted outside of Port-au-Prince, the capital. These results indicate that the prevalence of HIV-1 infection is high in Gonaives, a semi-urban area northeast of Port-au-Prince. Appropriate educational interventions to reduce the spread of HIV-1 infection and additional research to better define risk factors important in this population are needed.

Key words: HIV-1; HTLV-1; Haiti; prevalence; risk factors

T.G.0.22

RISING PREVALENCE OF ANTIBODIES AGAINST HUMAN IMMUNO-DEFICIENCY VIRUS (HIV-1) IN WESTERN MAHARASHTRA, INDIA.

K. Banerjee, National Institute of Virology, Pune, India.

Until recently HIV infection was considered a rare event in India. In 1982, 3/855 paid blood donors from Pune were seropositive and in 1988, 5/495 were positive. From Bombay a single serum was positive in the 4th quarter of 1987, since then 33 have been found positive. All were males. From a STD clinic in Pune, a single sample of blood was positive in 1987, while in 1988 there were 28 seropositives. From Bombay, a single sample was positive in 1st quarter of 1987, by the end of 1988 there were 56 positives, 46 being males and 10 females. Of the 449 sera collected from female prostitutes in Pune between 1985-87, only two were seropositive. From Bombay 5 were found positive in the 2nd half of 1986, by the end of 1988, there were 78 positives, 62 in the last quarter. Among hospitalized patients (other than STD) in a Pune hospital, only one of 863 tested was positive, which was from a group of 292 patients of tuberculosis. From Bombay, 1 out of 19 thalassadimc and 2 out of 70 cases of chronic renal failure were seropositive, obviously due to transfusion. The limited serosurveys from Bombay, Pune and some other cities in Western India indicate that the HIV infection is spreading rapidly in the urban areas among the prostitutes and their clients (as evidenced by the progressive rise in seropositivity in STD clinics) and paid blood donors. The current status warrants wider serosurveys to assess the spread of infection and immediate implementation of anti-epidemic measures.

T.G.0.23

SECOND SEROPREVALENCE SURVEY AMONG BANGKOK'S INTRAVENOUS DRUG ADDICTS(IVDA).

S.Vanichseni*,W.Sonchai*, K.Plangsringarm*,P.Akarasewi**,N.Wright**,K.Choopanya*,*Bangkok Metropolitan Admin.,**Div.Epid.,Min.Pub.Hlth.INDIA

Objective. To (1)determine prevalence,and(2)risk factors for HIV infection,and(3)measure recent behavioral change in an estimated population of 15,000 registered drug abusers in Bangkok.
Methods. At each of 18 clinics on a selected day in Sept.1988,a 100% sample of detoxificants was asked to consent to an interview with a social worker and give a blood sample.
Results. Among the 1,811 subjects(almost no one refused),44% were HIV+,up from 16% in February.Significant risk factors emerging from multivariate analysis were equipment sharing,OR1.6(95CL1.1-2.4)and hx of being arrested in 1988,OR2.0(95CL1.5-2.8).We examined responses to behavior one month before interview compared to 4 months before that.Equipment sharing declined from 66to 60% (sharing with 4+people from 23 to 18%).Condom use among those sexually active was low (7%) and unchanged.While most IVDA claimed to clean their equipment,the methods they used remained ineffective.
Conclusions. HIV infection has been increasing 5points per month among Thai IVDA in 1988.Widespread injection equipment sharing is a key risk factor.There is no sign in mid-1988 that IVDA are changing their sharing,cleaning,or condom using behavior in response to intervention programs.

T.G.0.24

AIDS IN PAPUA NEW GUINEA - HETEROSEXUAL TRANSMISSION AND SOME IMPORTANT LOCAL CONSIDERATIONS.

Malau, Clement, Currie, B., Mondia, P. and Pyakalyia, T. Department of Health Papua New Guinea.

The first positive HIV antibody result reported to the Department of Health in Papua New Guinea (PNG) was from June 1987. The first confirmed AIDS case was reported in April 1988. By the end of 1988 there were 7 confirmed AIDS cases reported. Two cases were expatriate males with P.carinii pneumonia, 1 homosexual, 1 bisexual. The other 5 were PNG nationals, aged 18-27 years, and all had died by late 1988. Of these 5 there were 3 females and 1 male who had had multiple heterosexual partners,and 1 other male who was bisexual. Four cases fulfilled the criteria for HIV wasting syndrome ("slim disease"), and 1 had extrapulmonary M. tuberculosis as the indicator disease. Candidiasis and skin lesions were also evident in some cases. HIV infection was documented in the regular female sexual partners of the 2 male nationals.
Intravenous drug abuse is virtually unknown in PNG, but the reported incidence of STD has risen alarmingly in the last 10 years. In particular ulcerative disease from syphilis and donovanosis is common. The importance of traditional tattooing and scarification remains unclear, as does that of ritual homosexuality which is confined to limited areas. Multiple use of single syringes still occurs throughout the country. Our preliminary data together with the high prevalence of tuberculosis suggest that the PNG AIDS epidemic is likely to follow the African pattern, with heterosexual spread and patients presenting with wasting and tuberculosis.

Regional Workshop: Asia

T.G.0.25

HIV TRANSMISSION AMONG INTRAVENOUS DRUG ABUSERS

Phanuphak, Praphan*; Poshyachinda, V.*; Un-eklabh, T.*** and Rojanapithayakorn, W.***
*Chulalongkorn University, **Thanyarak Hospital,
***Ministry of Public Health, Bangkok, Thailand.

HIV infection among Thai intravenous drug abusers (IVDA) is a relatively new event. HIV infection rate among IVDA in Bangkok increased abruptly from 1% in late 1987 to 15% and 43% in March and August 1988 respectively. The impact of the widespread HIV infection among IVDA is tremendous. Many of their wives were also infected and some were connected with sex trades. Pediatric AIDS is a potential problem. In addition, the threat to general public is intensified by the fact that up to 73% of the IVDA has ever donated blood.

No immediate effective solution for Thailand's estimated 100,000 drug addicts can be easily derived. Almost all of the Thai IVDA share needles, particularly during the early phase of practising IV injection. Syringe exchange and methadone maintenance programs are unlikely to be successful. Effective drug dependence treatment programs, health education including safe injection practice; and strict law enforcement may offer some hope to slow down the HIV epidemic among IVDA. In parallel, mass distribution of free condoms and vaginal spermicides to all IVDA irrespective of their HIV status offers the hope to prevent HIV transmission to their spouses and offsprings. It is anticipated that the lesson learned in Thailand will help in AIDS prevention strategies among IVDA of other Asian countries where this problem has not yet emerged.

T.G.0.26

HIV TRANSMISSION THROUGH BLOOD/BLOOD PRODUCTS IN INDIA: DIFFICULTIES IN CONTROL AND SUGGESTED STRATEGIES

Khorshed Pavri; ICMR Centre for AIDS Research and Control, Haffkire Institute, Parel, Bombay

Objectives: To present data on blood donors including professional donors used by manufacturers of blood products. To present difficulties in implementation or screening and control programmes and to suggest some strategies.
Methods. The very first AIDS case recorded in May 1986 in India was in a person who received blood transfusion in the U.S. in June 1980. Since then, there have been 33 AIDS cases. Two of these (6.6%, associated with indigenous blood/blood product. Overall rates of HIV infection in blood donors range from 0-0.35% with a higher rate (0.15-7%) for paid donors. Only two States - one each from Western and Southern India have recorded seropositivity among blood donors. These have also reported one case of AIDS each in recipients of blood/blood products. Some marketed products have shown HIV antibodies but no evidence of HIV antigen Subsequently, a spurt in seropositivity was noted in commercial donors. This spurred a Governmental ban on all blood products and production, irrespective of whether it is human albumin or Factor VIII. Simultaneously, there is a hectic activity to enforce mandatory screening of all blood donors, at least in the two States. Yet in another State, a solitary positive Indian blood donor fell a victim to a law meant to incarcerate HIV-infected foreigners. These and other difficulties in screening are discussed and some strategies suggested.
Conclusion. Nations like individuals prefer to learn only from their own mistakes.

HEALTH EDUCATION STRATEGIES IN CONTROL

Choudhury, Shankar. Centre for Community Medicine
All India Institute of Medical Sciences, New Delhi, India.

T.G.0.28

S. Pattanayak, WHO. Strategies for Regional and International Cooperation.

Objectives - To have effective control of HIV and AIDS through a well coordinated programme at the global, regional and country level.

Methods - Considering the situation of AIDS in South-East Asian countries the Regional plan of action was formulated in 1987 which comprises of S E B - Surveillance, Education and Information on AIDS, Blood and Blood Products and its safe use. This strategy are in order of priority. With the active coordination and participation, prevention and control activity against AIDS are in progress in all the countries of the Region.

Results - All the countries have initiated short-term plan of action for prevention and control of AIDS and Medium-term plan of action have been initiated in four out of eleven countries of the Region. Health Education and information activities have been intensified. Some countries have initiated screening of blood donations for prevention of AIDS through transmission from blood. The collaborative effort of global, regional and country level will be discussed during the presentation.

Conclusion - The countries have shown their interest in undertaking AIDS control activities for which plan of action have been developed and are being implemented.

HIV in Pediatrics

W.G.0.1 INABILITY TO DEMONSTRATE A DOSE-RESPONSE EFFECT BETWEEN RECEIPT OF MOTHER'S MILK AND PERINATALLY-ACQUIRED INFECTION (PI) IN A COHORT OF 114 INFANTS BORN TO HIV(+) MOTHERS

Manzila, Tarande*; Baende, E.*; Kabagabo, U.*; Paquot, E**; Colebunders, R.*/***; Ryder, R.*/***. *Projet SIDA, Kinshasa, Zaire; **Clinique Ngaliema, Kinshasa; ***CDC, Atlanta, GA.

Objective. To determine the incidence of PI in a cohort of breastfed infants born to HIV(+) mothers at a maternity in Kinshasa, Zaire.
Methods. At a maternity for the more economically well-off children in Kinshasa, Zaire, infants of 114 HIV(+) mothers have been followed since birth for evidence of PI (HIV IgG at age 12/18 months or clinical AIDS). Relative amounts of artificial(AM) and mother's milk(MM) consumed since birth were calculated/3 month period.
Results. Twenty one (18%) of the 114 infants developed PI. All study infants were delivered vaginally. The nonsignificant association between infant milk source during the first 3 months of life and PI is shown in the following table:

	AM only(n=16)	AM+MM(n=65)	MM only(n=33)
Infected (PI)(n=21)	4 (25%)	11 (17%)	6 (18%)
Non-infected (n=93)	12	54	27
Relative Risk	1.0	0.6	0.7 (P=NS)

Similar comparisons between PI and milk source at 6, 9 and 12 months of life also failed to demonstrate a significant dose-response effect for consumption of MM and PI.
Conclusions. The presence of mixed infant feeding practices at a Kinshasa clinic where mothers have an increasing tendency to not breast feed their children provided us with an opportunity to evaluate the risk of PI to an infant born to an HIV(+) mother. The low infectiousness of MM is suggested by the finding that 17% of the 98 infants receiving BM and 25% of 16 infants receiving AM developed PI(P=NS). Our study supports current WHO recommendations that nearly all HIV-positive mothers in Africa, because of socioeconomic and ecologic environmental constraints, should exclusively breast feed their children until weaning.

W.G.0.2 Symptomatic Children with Perinatally Acquired HIV Infection in Puerto Rico:The San Juan City Hospital and University Pediatric Hospital

Clemente Dìaz MD, E.Jimènez MD, L.Lòpez MD,R.Lòpez-Correa MD M.Carrer MD,J.M Garcìa MD;et al.The University of Puerto Rico School of Medicine, Puerto Rico, U.S.A.

OBJECTIVE: To describe demographic,clinical and outcome features of symptomatic children with perinatal HIV infection.
METHODS:Symptomatic children (CDC.Class2) with perinatal HIV infection were followed from 1984 to 1988.Demographic,clinical and outcome variables were uniformly abstracted in each center.
RESULTS: Of 89 symptomatic children (50 boys,39 girls) 54 (60%) were alive up to December 1988; 8 (10%) had been lost to follow-up. Median age of survivors,46 mo. (range 1-120 mos.) with symptoms related to HIV appearing from 2 wks. to 34 mo. of age. A history of IVDU was present in one, both parents or mother's previous sex partner in 93% of families. Predominant signs and symptoms included hepatosplenomegaly (84%) diffuse adenopathy (76%), lymphoid interstitial pneumonia (38%) and growth failure(65%). Patients who died (27/81=30%: 16 boys. 11 girls) had significantly lower median age at onset of symptoms (12 mo.) and age at diagnosis (9 mo.) than survivors ($p < .01$). Mean survival time from diagnosis to death in girls was significantly less than boys (4.6 mos.vs.9.8, $p < .05$).
CONCLUSIONS:Children with perinatal HIV infection who died had a lower median age at onset of symptoms; mean survival time from diagnosis to death in girls was less than in boys.

W.G.0.3 COMPLICATIONS LOCO-REGIONALES DE LA VACCINATION PAR LE BCG CHEZ DES ENFANTS NES DE MERE POSITIVE POUR ANTI-HIV1 : Etude cas-témoins à Brazzaville (R.P.CONGO)

Sophie Lallemant Le Coeur*, D.Cheynier**, M.Lallemant***, S.Nzingoula**, J.Drucker****, B.Larouzé* et al. * INSERM U13 , Paris, ** Minist. Santé/DSMIES, Brazzaville, *** ORSTOM (S/URB)Brazzaville/Paris.****APMP, Paris.

Objectifs : Comparer la fréquence des complications loco-régionales de la vaccination précoce par le BCG chez des enfants nés respectivement de mère positive et négative pour anti-HIV1.
Méthodes : Dans le cadre d'une étude prospective et longitudinale sur la transmission maternelle d'HIV1 les complications loco-régionales du BCG ont été recherchées au 3ème, 6ème et 9ème mois chez 59 enfants nés de mère anti-HIV+ et 123 enfants nés de mère anti-HIV1-. Le BCG (Pasteur; 0,05 ml intradermique, face externe du bras gauche), avait été administré au cours du premier mois, dans le cadre du Programme Elargi de Vaccination. Toute adénopathie axillaire et/ou sus-claviculaire gauche isolée de plus de 1 cm de diamètre (en l'absence d'une autre cause infectieuse locale) a été considérée comme liée au BCG.
Résultats : Aucune ulcération n'a été observée au site d'injection; la fréquence et l'évolution des adénopathies liées au BCG a été identique dans les 2 groupes.

	Enfants nés de mère HIV+	Enfants nés de mère HIV-	
Adénopathie +	10 (16,9%)	20 (16,3%)	
Adénopathie -	49 (83,1%)	103 (83,7%)	X2=0.02 N.S
	59 (100%)	123 (100%)	

.Conclusion : Les complications loco-régionales du BCG ne sont pas plus fréquentes chez les enfants nés de mère anti-HIV1+. L'intégration du BCG au Programme Elargi de Vaccination (OMS) ne semble pas devoir être remise en cause dans des régions telles que l'Afrique centrale.

W.G.0.4 CAUSE-SPECIFIC MORBIDITY IN THE FIRST 18 MONTHS OF LIFE IN 477 INFANTS BORN TO SEROPOSITIVE MOTHERS IN ZAIRE.

Nsa, Wato*; Manzila, T.*; Mvula, M.*; Matela, B.*; Hassig, S.*; Ryder, R.*/**. *Projet SIDA, Kinshasa, Zaire; **CDC, Atlanta, GA. U.S.A.

Objectives. To describe the causes of morbidity and their incidence in children with perinatal HIV infection(PI) in Kinshasa, Zaire.
Methods. Through the age of 18 months, all episodes of illness in 120 children(Group I) with HIV(+) mothers and PI (HIV IgG at age 12/18 months or clinical AIDS), 357 children(Group II) with HIV(+) mothers but without PI, and 590 control children(Group III) of HIV(-) mothers have been observed monthly for a total of 1,380 child-years. The lost to follow-up rate at 18 months was 4%.
Results. Episodes of illness/child-year by infant HIV infection status

Illness	Gp I	Gp II (p)	Gp III (p)
Fever >15 days	.559	.078 (<.01)	.077 (<.01)
Diarrhea >15 days	.398	.092 (<.01)	.122 (<.01)
Pneumonia	.782	.322 (<.01)	.386 (<.01)
Oral thrush	.617	.117 (<.01)	.088 (<.01)
Papular dermatitis	.539	.266 (<.01)	.180 (<.01)
Meningitis	.027	.021 (NS)	.004 (<.05)
Purulent otitis media	.505	.247 (<.05)	.121 (<.05)
Herpes zoster	.000	.000 (NS)	.000 (NS)
Measles	.074	.033 (<.05)	.037 (<.05)

(p values compare incidence in Gp I with Gp II and Gp I with Gp III
The cumulative incidence of AIDS in children born to seropositive mothers was 115/1000 HIV(+) mothers at age one year and 159/1000 at age 18 months.
Conclusions. Excluding herpes zoster, Gp I children experienced two to five-fold higher incidence rates of illness than Gp II or Gp III children. Over one half of Gp I children experienced fever, pneumonia, oral thrush, and purulent otitis media during the 18 month observation period.

W.G.0.5 HIV DISEASE IN INFANTS AND CHILDREN: 22 MONTHS PROSPECTIVE STUDY

Adel E.A. Malek, K. Mukelabai, E.P. Luo
University Teaching Hospital, Lusaka, Zambia.

OBJECTIVE: To determine the short and long term sequelae of HIV Disease in infants and children over the period of twenty-two months study.
METHODS: A total of 405 suspected in-patients and their mothers were screened for anti-HIV antibodies using ELISA (Abbott or Wellcozyme). Ninety-four children diagnosed as having HIV disease were followed monthly, out of which 53 cases with whom we started the study were followed for a complete 22 months period, and the remaining 41 cases were recruited during the study, to determine the pattern of illness occurring in them as a result of their HIV disease.
RESULTS: Of 405 screened, 94 (23.2%) were seropositive. The age range was 2 months to 52 months (peak: 1 - 2 years). Male/Femal ratio was 1.1:1. Eighty-eight were born to seropositive mothers. The 53 patients followed for 22 months required readmissions on average between 4 - 6 times. The spectrum of diseases occurring in the 94 cases at time of presentation, review or readmission (most had more than one disease at each presentation), were failure to thrive with severe malnutrition in 79 (84.0%), acute gastroenteritis in 58 (61.7%), deteriorating or reactivated pulmonary tuberculosis in 37 (39.3%), pneumonia in 21 (22.3%), cancrum oris in 19 (20.2%), proved malaria in 19 (20.2%), severe anaemia in 18 (19.1%), suppurative otitis media in 9 (9.6%), Kaposi's Sarcoma in 5 (5.3%), pyogenic meningitis in 3 (3.2%), and measles in 3 (3.2%). Out of 94, 33 died, and of 53 cases followed for 22 months 23 died.
CONCLUSION: HIV Disease in infants and children is a very aggressive disease carrying very high morbidity and mortality. The majority of patients presented with failure to thrive and diarrhoeal disease.

W.G.0.6 BIOLOGICAL MARKERS ASSOCIATED WITH PROLONGED SURVIVAL IN HIV-INFECTED CHILDREN.

Van de Perre, Philippe*; Lepage, P.**; Hitimana, D. G**; and Nsengumuremyi, F.**
* Programme National de Lutte contre le SIDA, Kigali, Rwanda and ** Department of Pediatrics, Centre Hospitalier de Kigali, Kigali, Rwanda.

Objective: To identify biological markers associated with long survival in HIV-infected African children.
Methods: Sixteen HIV-seropositive children (P.), aged 5 to 12 years (9 girls, 7 boys; mean age, 6.5 yrs) who were born to HIV-infected mothers were enrolled and compared with 16 age and sex matched HIV-seronegative controls and with 16 consecutive pediatric AIDS patients (8 girls, 8 boys; mean age 1 yr). Two serum samples at 7 month intervals were available in 11/16 P. They were all tested for HIV IgG by WB (Biotech), for HIV IgM by WB after precipitation of Rheumatoid Factor, for T-lymphocytes subpopulations, and for serum IgG, IgM, and IgA by radial immunodiffusion (Behring).
Results:

	P.	controls	pediatric Aids
WB IgG anti-p17	16/16*	0/16	9/16
anti-p24	16/16	0/16	16/16
WB IgM	14/16*	0/16	2/16
Mean serum Ig, g/l			
IgG	40.8*	16.9	22.3*
IgM	3.4	2.2	3.4
IgA	3.0	2.4	2.1
Lymph. subsets, %			
OKT4+	13.5*	39.5 *	ND
OKT4A+	13.7*	38.1 *	ND
OKT8+	50.3*	22.3 *	ND
Ia+	25.0*	14.5 *	ND

* p< 0.01

HIV IgM in the P. were directed to gag-encoded proteins only in 3/14 P. and to gag-and env-encoded proteins in 11/14 P. The HIV IgM detection was neutralized after pre-incubation of the serum samples with mouse anti-human mu-chain diluted 1:5.
Conclusions: A persistent IgM response to a wide range of HIV proteins and a persistent IgG response to HIV p17 are associated with a prolonged course of pediatric HIV infection. If confirmed, these results should be considered as arguments for selective passive immuno-therapy trials of pediatric HIV infection.

Infections parasitaires tropicales : impact du VIH
Tropical Diseases: The Impact of HIV

W.G.0.7 STUDIES OF THE RELATIONSHIP BETWEEN PLASMODIUM FALCIPARUM MALARIA AND HIV INFECTION IN AFRICA

Greenberg, Alan E.*, *AIDS Program and Malaria Branch, Centers for Disease Control, Atlanta, Georgia, USA.

The epidemic of HIV-related disease in areas of Africa where *Plasmodium falciparum* (PF) malaria is endemic has generated serious concerns about potential interactions between the two infections. To address these issues, a series of epidemiologic investigations have been conducted at Mama Yemo Hospital in Kinshasa, Zaire since 1986. Multiple cross-sectional studies among hospitalized pediatric, pediatric emergency ward, adult emergency ward, healthy adult, and obstetric populations have failed to detect a positive association between PF infection and HIV seropositivity, although a small number of HIV+ adults with severe malaria have been identified. In 1986, studies revealed that children with profound anemia associated with acute and severe malarial infections were being treated with blood transfusions that were unscreened for HIV antibodies, and were consequently being infected with HIV; these results contributed to the establishment of an effective HIV blood screening program at Mama Yemo Hospital. An ongoing, longitudinal cohort study of children born to HIV+ and HIV- mothers revealed no differences in the incidence, severity, or response to anti-malarial therapy of PF malaria after six months of clinical follow-up; data collected during the first year of follow-up of these children will be presented.

W.G.0.8 LEISHMANIASIS AND LEPROSY

Johnson, Warren D. Department of Medicine, Cornell University Medical Center, New York, N.Y. USA.

W.G.0.9 ISOPORA BELLI AND OTHER SPOROZOA

Pape, Jean. Department of Medicine, Cornell University Medical Center, New York, N.Y. USA.

W.G.0.10

MICROSPORIDIOSIS AND ARC

CALI, ANN* and OWEN, ROBERT L.**
*Dept. Bio. Sci., Rutgers University, Newark, New Jersey, USA.
**Cell Bio.& Aging Sect.(151E), VA Med. Center, San Francisco, Calif., USA.

Microsporida are obligate intracellular protozoa which are ubiquitous throughout the animal kingdom and characterized by spores containing coiled polar tubules which evert and penetrate host cells into which the spore contents are extruded. Prior to HIV infections, microsporidiosis was only reported from immune incompetent individuals or immune priviledged sites in otherwise normal individuals. Four microsporidian genera have been identified in man but only one seems to be repeatedly associated with the HIV-ARC, *Enterocytozoon bieneusi*. This microsporidian is associated with diarrhea and malabsorption and can only be diagnosed by histological examination of endoscopic biopsies taken from the duodeno-jejunal and ileal mucosa. Histopathological changes include villus atrophy, mild inflamitory infiltrate and round to oval basophilic bodies in villus enterocytes. Electron microscopical observation of spores containing the coiled polar tubule confirm a microsporidian diagnosis.

W.G.0.13

AIDS AND RESTRICTIONS ON IMMIGRATION AND TRAVEL: U.S. POLICY AND ITS RAMIFICATIONS.

Edwards, Richard K.*; Whitaker, Rupert E.D.**.
*Northeastern University and Pine Manor College, Boston, Mass., U.S.A.,
**Boston University and Tufts New England Medical Center, Boston, Mass., U.S.A.

Objective. To evaluate the efficacy of the U.S. government's policy of excluding immigrants with AIDS and HIV infection.
Methods. WHO data on AIDS were used to obtain estimates of the prevalence of HIV infection for those countries reporting in February, 1988. These estimates, along with data on the volume (and country of origin) of immigrants entering the U.S., were used to examine the outcome of mass HIV antibody testing of applicants for immigrant status. The study assesses the adequacy of ELISA and Western Blot tests as measures of HIV infection, particularly with a view to border controls as a means of controlling the spread of AIDS.
Results. The proportion of test results that are false varies according to the prevalence of HIV infection in the population being tested. Thus, applicants from "high-risk" areas are more likely to produce false negative results, while those from "low-risk" areas are more likely to produce false positive results.The policy of excluding seropositives from the U.S. will therefore be inconsistent, and will affect applicants from certain areas more severely than others.
Conclusion. Attempts to contain the AIDS epidemic in the U.S. by exercising border controls will not only be ineffective, but also counter-productive, as other countries will respond by imposing controls upon U.S. citizens.

W.G.0.14

COMPARISON OF NATIONAL AIDS STRATEGIES IN AUSTRALIA AND CANADA

Duckett, Margaret
McGill Centre for Medicine, Ethics and Law; Montreal, Quebec, Canada.

OBJECTIVE - To delineate a policy framework and examine the development and implementation of National AIDS strategies in Australia and Canada with attention to consultation, policy directions, resource allocation, time frame, consistency and comprehensiveness.
METHOD- A review of the evolving social, political and legal positions dealing with HIV infection in Australia and Canada based on interviews and published reports.
RESULTS - Issues include:1) The accepted basic principles which underlie the process of policy formulation.
2) The areas and limits of responsibility that are drawn.
3) The ethical issues that are addressed, both overtly and covertly.
4) The identification of those groups whose input is seen as crucial.
5) The guidelines adopted for resource allocation.
6) Financing arrangements.
7) Research priorities in biomedical, behavioural and social research.
8) The homogeneity of the national response.
Conclusion - Despite similar health care systems and national disease profiles, critical distinctions between the two countries have occurred in the timing of the response, the extent of involvement of all relevant groups, the emphasis on and effect of prevention strategies and the extent to which national policies have addressed ethical issues. The characteristics of a recommended national strategy are outlined, drawing on the strengths, and weaknesses of the two countries.

W.G.0.15

THE EPIDEMIOLOGICAL SURVEILLANCE SYSTEM FOR AIDS IN BRAZIL - CRITICAL ASSESSMENT

Rodrigues, Lair*, Chequer, P*, Bergamaschi, D*, Castilho, E**, De Paula, L.*
*Ministry of Health-National Division of STD/AIDS, Brasília, Brazil, ** Oswaldo Cruz Foundation/Ministry of Health, Rio de Janeiro, Brazil

Objective. To present methodological and operational aspects of the National AIDS Epidemiological Surveillance System. Critical assessment of the components of the System and presentation of the new epidemiological notification card, applied nationwide.
Methods. Qualitative and quantitative evaluation of the National AIDS Epidemiological Surveillance System using the current report form, standardized nationwide, which contain demographic data, on opportunistic diseases, results of laboratory tests and risk factors.
Results. The National AIDS Epidemiological Surveillance System was implemented in 1985 and since then has been progressively expanding in coverage and operational capacity. It is organized hierarchically, and its various levels of activities are defined. The data is organized and processed by epidemiological work, generating monthly feedback by means of national and state epidemiological bulletins. The reported form currently used may be considered satisfactory, nevertheless it needs some modifications. The new form to be presented will allow for the proposed new case definition based on the nosological profile observed in research carried out by the National Division of STD/AIDS with the support of CDC-USA, and operational observations. The flow and quality of the data may be improved by the mechanisms proposed in this paper. The under-reported cases can be reduced by its quantification, identification of bottlenecks, and the motivation and training of professionals.
Conclusions. The National Epidemiological Surveillance System is wide-ranging and is in the implementation phase. The retrospective retrieval of occurrences even from periods prior to its setting-up has been an important aspect in the development of the epidemiological profile of AIDS in Brazil. The proposed new form is expected to make the System more operationally responsive and enable better knowledge of the nosological profile of AIDS. The flow of data, can be optimized and consequently lead to an improvement in the processing and feedback of the System. In addition, this study will generate guidelines for evaluation of the National Surveillance System.

W.G.0.16

FUNCTIONAL AND DYSFUNCTIONAL AIDS PREVENTION PROGRAMS IN LATIN AMERICA AND THE CARIBBEAN

Fernando R.K. Zacarías, Laurent F. Zessler, Gloria Mongalo,
Fabio Luelmo, and Ronald K. St. John
Pan American Health Organization, Washington, D.C., USA
Global Programme on AIDS, World Health Organization, Geneva, Switzerland

Objective: To assess the functional/dysfunctional status of AIDS prevention programs in Latin America and the Caribbean (LAC) from a managerial perspective.
Methods: Following WHO guidelines, we assessed the structure of national AIDS programs as well as their efficiency or capacity to implement planned activities (activities completed/activities programmed).
Results: As of 1 January 1989 all of the 36 PAHO Member Countries had a national AIDS prevention focus. However, the structure and functions of the national AIDS prevention programs varied greatly among countries at comparable stages of the epidemic. For example, of the twenty Latin American national programs ten were considered to be using resources more rapidly and more efficiently than the rest. Eight of these ten countries had a full-time manager devoted exclusively to the AIDS/STD program. These countries showed evidence of "strong" governmental political and financial commitment to the AIDS prevention effort (e.g. composition of the AIDS commission, internal funding, legislation, and active search for external bilateral or multilateral support). In contrast, these two factors were present in only two of the ten less active programs.
Conclusions: Our preliminary data seem to indicate that certain program characteristic may predict the efficiency with which national programs are implemented.

W.G.0.17

STRATEGIES OF THE EEC'S AIDS PROGRAMME FOR DEVELOPING COUNTRIES TO CONTROL SEXUALLY TRANSMITTED HIV INFECTIONS. DISCUSSION OF PROGRAMME IMPLEMENTATION AND MAIN ISSUES.

Fransen, Lieve, MD, PHD ; van Dam, C.J., MD, MSc
European Economic Community - AIDS Control Programme/Developing Countries.

Sexual transmission is by far the most important way for HIV infection to spread. All STDs are behaviourally correlated and follow the same high risk behaviour pattern, namely multiple or infected sexual partners. Risk markers permit focusing of intervention efforts. Therefore the basic approach of the EEC's AIDS Programme has been to place AIDS within the context of other STDs. Main activities and issues are : focused information campaigns, organisation of adequate training, confidentiality, use of STDs as indicators as well as for evaluation of intervention, adequate management of genital ulcers and other STDs and strengthening of STD and AIDS programmes. All activities have been undertaken in collaboration with WHO. Against this background we will present the first results of programme implementation, operational research and evaluation. A quick assessment method for STDs and AIDS has been developed. Cost and cost recovery issues and resources availability have been analysed and discussed in view of sustainability and resource allocation. Applicability, feasability and impact will be analysed for a few examples of interventions in specialised STD clinics or integrated in primary health care facilities.

W.G.0.18

NATIONAL AIDS PROGRAMMES. PROGRESS ACHIEVED AND OPPORTUNITIES FOR FURTHER DEVELOPMENT

Tarantola, Daniel; Mann, Jonathan. World Health Organization, Global Programme on AIDS. SWITZERLAND

The global mobilization against AIDS increased considerably in 1988 as Governments were gradually responding to the worldwide spread of the HIV epidemic by establishing policies and undertaking aggressive programmes. Of 187 countries and territories in the world, 163 had, as of 1 February 1989, sought a technical collaboration with the World Health Organization's Global Programme on AIDS, of which 152 had already received a technical visit. Of those, 118 countries had completed or were implementing a short-term prevention and control plan, while 51 had embarked on a 3- to 5-year medium-term programme. Of those, 27 were able to mobilise resources through pledging meetings (Table 1). The status of the global reaction to AIDS will be reviewed. Collaboration and cooperation within and between countries will be summarized and current issues encountered in improving programme performances will be discussed.

TABLE 1

WHO GLOBAL PROGRAMME ON AIDS - NATIONAL PROGRAMME SUPPORT - 1 FEBRUARY 1989

WHO Region	Countries/ Areas	Collaboration Requests	Technical Visits	Short-term Prog.	Medium-term Prog.	Resource Mobilisation
Africa	45	44	44	44	30	14

Transmission hétérosexuelle et rôle des MTS
Heterosexual Transmission and the Role of STDs

W.G.0.19 Health Education among Commercial Sex Workers in Zimbabwe, Africa.

David Wilson, Babusi Sibanda, Lilian Mboyi, Sheila Msimanga and Godwin Dube, Department of Psychology, University of Zimbabwe, Zimbabwe, Africa.

Commercial sex workers and their clients in Africa are at risk for HIV infection. One hundred and fifteen commercial sex workers (CSWs) were interviewed in Bulawayo, Zimbabwe. The average educational level of the CSWs was low. Unemployment and divorce were cited as the major reasons for engaging in commercial sex work. Most CSWs cited fear of STDs as the worst aspect of their work. Most CSWs had heard of AIDS and most considered themselves to be at high risk for the disease. However, their knowledge of the transmission and prevention of HIV was very limited. Few CSWs regularly used condoms and most stated that this was due to a resistence to condoms on the part of their clients. Nearly all CSWs accepted condoms from the interviewers, wanted more information on AIDS and were willing to take part in a condom promotion intervention and this intervention has been established. It is concluded that while further education is important among CSWs, it is also vital to change their clients' attitudes to condoms.

W.G.0.20 SURVEILLANCE- EDUCATION SANITAIRE DES PROSTITUEES AU SENEGAL

SIBY Tidiane*, THIOR I.*, SANKALE J.L.*, GUEYE A.*,NDOYE I.**,MBOUP S.*, et Coll.
*Bactério-Virologie/Université de Dakar, **Clinique MST/IHS Dakar

OBJECTIF : Sensibiliser une population à activité à risque pour rompre la chaîne de transmission du HIV et des autres MST
METHODES: Au Sénégal, 15 % des prostituées sont porteuses d'Ac anti-HIV contre 0,6% dans la population de contrôle. Au cours des visites sanitaires périodiques instituées grâce à la réglementation de la prostitution, 1700 prostituées ont profité des séances d'éducation et d'information où modes de contamination, manifestations cliniques , moyens de prévention des MST et du SIDA sont débattus.
RESULTATS:De plus en plus, nous notons qu'un climat de prise de conscience commence à se répandre parmi elles (souvent en possession de préservatifs, prélèvements vaginaux pathologiques en régression). Mais, le refus des clients d'user de préservatifs, les raisons d'ordre économique qui les poussent à enfreindre les mesures de prévention, le nombre élevé de prostituees clandestines ... sont autant de facteurs qui rendent cet apprentissage difficile.
CONCLUSION: Une information permanente et soutenue, une stratégie permettant de cibler les clandestines, des préservatifs de qualité, peu onéreux et à portée de main contribueront à diminuer considérablement la dissémination du HIV et des autres MST au SENEGAL.

W.G.0.21 PROSTITUTES AS HEALTH EDUCATORS FOR THEIR PEERS IN YAOUNDE: CHANGES IN KNOWLEDGE,ATTITUDES AND PRACTICES.

Marcel Monny-Lobe*,D.Nichols**,L.Zekeng***,R.Salla*,L.Kaptue*
*Central Hospital Yaounde,Cameroon,**Family Health International,NC,USA,***University Teaching Hospital Yaounde.

Objective.To demonstrate that prostitues can be effective in AIDS education for their peers in Africa.
Methods.KAP surveys were conducted among prostitutes in Yaounde:125 in January 1988, 79 of the 125 in July and 87 of the 125 in December.Simultaneously an educational campaign was carried out for them by 11 leaders-prostitues selected and trained on STDs and AIDS and safer sex practices.

Results.	January 1988	December 1988
Do not know that AIDS is spread by sex	11,2%(14/125)	3,4%(3/87)
Do not.know that AIDS is spread by blood	18,4%(23/125)	8% (7/87)
Think that it is by shaking hands	28% (35/125)	10,3%(9/87)
Think that it is by kissing	49,6%(62/125)	13,7%(12/87)
Do not know a healthy person can spread	36% (45/125)	17,2%(15/87)
Could not name any symptom of AIDS	25,6%(35/125)	9,2%(8/87)

In January 20% had never heard of condoms and 60% had never used them;when asked to list possible practices to reduce their own risk: 44% said they could use condoms,23% spermicides and 21% reduce their number of partners.

Behavior changes:	January 1988	July 1988	December 1988
Use of condoms(at least ½the time)	28% (35/125)	95% (75/79)	72,4%(63/87)
Use of spermicides	16% (20/125)	59,4%(47/79)	85% (74/87)
Reduce or select clients	28,8%(36/125)	39,2%(31/79)	42,5%(37/87)
No change	22,4%(28/125)	17,7%(14/79)	12,6%(11/87)

Conclusion.The peer education is an effective method for prostitutes in Africa.

W.G.0.22 SOCIAL CHARACTERISTICS AND SEXUAL BEHAVIOUR OF WOMEN IN THE HIGH RISK BEHAVIOUR CATEGORY

Katsivo, M.N. and Muthami, L.N.
Kenya Medical Research Institute, Nairobi, Kenya.

General Objective To define the seroprevalence of HIV infection and related social characteristics among Kenyan women in the high risk category.
METHODS This is a report of a pilot study in preparation for the main study which was designed to cover all the major urban areas of Kenya. The study was conducted on a sample of 47 women of high risk behaviour category in one of the urban areas. The 47 women were interviewed individually for information related to their social characteristics and sexual behaviour.
RESULTS Occupation: 43(91%) of them were bar attendants. Education: 65% had had 1-4 years of formal primary education. Marital Status: 95% were either not married or were divorced, and all of them had at least one child. Sexual behaviour: Apart from one woman who practiced anal sex, the rest practised vaginal sex. 53% charged for sex. Opinions on condom use and number of sexual partners differed. The implications of this pilot study will be discussed.

CONCLUSIONS The women lacked knowledge of the advantages of condom use. Given the very goodresponse rate, deeper investigations into the choice of the particular profession should be included.

W.G.0.23 AIDS PREVENTION AMONG BRAZILIAN PROSTITUTES: A PILOT PROJECT

Mathias, Telma*; Borges, Francisca*; Delgrange, Felipe**; Rodrigues, Lair***
* Secretaria de Saúde do Estado do Ceará - Fortaleza - Ceará - Brazil; ** Inter AIDE – França; *** Divisão Nacional de Doenças Sexualmente Transmissíveis/AIDS - Ministério da Saúde - Brasília – Brazil

A pilot project for AIDS information and education was conducted among registered prostitutes in the city of Fortaleza – Northeast Brazil. The project was implemented by the Ceará State Health Department with the technical and financial assistance of Impact/INTERAIDE.

Objective: To provide acceptable information to prostitutes, in order to change their high risk behaviors.

Methods: A total of 214 registered prostitutes was enrolled in the project. Their clients were also enrolled. Information was provided to prostitutes by individuals selected from senior medical, nursing and social work students. The students were trained in communications skills, then teamed by two and assigned to visit the brothels included in the program weekly.
Medical check-ups and contact tracing were also done

Conclusion: This approch was well accepted by the community, the cost was low, resulted in bidirectional communication, and proved to be effective in promoting the use of condoms and in avoiding discrimination and moral judgment.

W.G.0.24 SEXUAL PRACTICES AND HIV.INFECTION OF FEMALE PROSTITUTES IN NIGERIA.

Williams Eka+, Hearst-N*, Udofia O+.
+University of Calabar, Calabar, Nigeria, *Centre for AIDS Prevention Studies UCSF, San Francisco, USA.

Objective: To determine the sexual practices of female prostitutes in Nigeria which may affect their risk of HIV infection.
Methods: A questionnaire was administered to consenting female prostitutes residing in hotels or compounds in Calabar metropolis. HIV testing was performed by ELISA and RIPA.
Results: Data from 67 prostitutes, 15-55 years old showed that: The mean number of paying clients seen daily per prostitute was 4.4 (range 2-10), as well as keeping between 1-5 non paying clients. All prostitutes within the same premises frequently interchanged paying clients. 56/67 (83.6%) reported previous use of condoms, though infrequent. Higher charge for condom use was admitted by 26/56 (46.4%) condom users. Vaginal intercourse was exclusively practised. 20/67 (29.9%) of prostitutes received clients during menstruation. 35/67(52.2%) admitted to sexual contact with foreign clients. A mean of 8.9 clients (range 0-40) per month were refused intercourse by each prostitute on suspicion of STD. A focus group reported vaginal use of ground tobacco leaves by older prostitutes as prophylaxis for STD. Of 55 prostitutes tested, antibodies to HIV-1 were undetected, while 1(1.8%) person was confirmed positive for HIV-2.
Conclusion: Female prostitutes in Nigeria must be educated on safer sexual practices and provided with regular and cheap supply of condoms to reduce their risk of HIV infection.

Prévalence (partie 3)
Prevalence (Part 3)

W.G.0.25 THE USE OF HIV SURVEILLANCE DATA FOR GUIDING NATIONAL AIDS PROGRAMME DECISIONS

Slutkin, G.[1*], Chin, J.[2*], Tarantola, D.[3*], Mann, J.[4*]
*World Health Organization, Geneva, Switzerland.

Objective: To review and discuss how HIV surveillance data can be used to guide National AIDS Programme decisions.

Methods: Analysis of the specific HIV data needs for various AIDS programme decisions.

Results: As the HIV pandemic spreads to new areas and populations, there is an urgent need to further expand the public health monitoring of HIV seroprevalence to direct public health programmes. A variety of data sources are currently available regarding HIV seroprevalence in different population groups. Many national AIDS control programmes have selected a system of sentinel serosurveillance as the basis of their HIV surveillance programme. This is a simplified method of regular sampling at pre-determined sites, in which the sampling occurs according to pre-determined methods and schedules. This presentation will review the current status of public health surveillance systems in developing countries with specific emphasis on what surveillance data, with what precision and frequency are needed to guide public health programme decisions.

Conclusion: A logical framework to guide HIV/AIDS programme policy decisions can be developed utilizing data collected by HIV sentinel surveillance systems.

W.G.0.26 SUGGESTION OF A STABILIZATION OF HIV INFECTION IN SELECTED POPULATIONS IN ZAIRE BETWEEN 1986 AND 1989

N'Galy, Bosenge*; Ryder, R.**/***; Kamenga, M.**; Kapita, B.****; *National AIDS Programme Coordination Bureau, Kinshasa, Zaire; **Projet SIDA, Kinshasa; ***CDC, Atlanta, GA; U.S.A. ****Mama Yemo Hospital, Kinshasa.

Objective. To describe the trends of HIV infection in selected populations of convenience in Zaire between 1986-1989.

Methods. Between 1986 and 1989, serial cross-sectional prevalence surveys of similar population groups have been carried out in Kinshasa (KIN) and in selected rural areas of Zaire. In addition, HIV incidence has been determined in 2 longitudinal cohort studies involving 9,886 person-years of follow-up. One study has involved 2193 KIN hospital workers while the second has involved 5500 employees and their wives at a KIN textile factory.

Results

		Prevalence(%) 1986	1987	1988	1989
Blood donors	KIN	9.0	7.7	4.8	Pending(P)
	Rural	-	1.5	1.0	P
Pregnant women	KIN	7.1	6.7	3.4	5.3
	Rural	3.0	-	2.2	P
Female prostitutes	KIN	27	-	40	P
	Rural	11	-	-	P
General population	KIN	-	3.0	3.8	2.9
	Rural	0.8	-	1.0	P
		Yearly Incidence(%)			
Factory workers	KIN	-	-	0.6	P
Hospital workers	KIN	1.6	-	-	P

Conclusion. Our data reflect HIV infection in only the populations we sampled and should not be used to assess the overall HIV situation in Zaire. Except for a progressive increase in seroprevalence in KIN prostitutes, the continuing occurrence of incident cases of infection in the face of a relatively stable seroprevalence suggests the possible emergence of a steady state of HIV infection in the groups studied. Additional explanations for the apparently stable HIV prevalence need to be pursued. A large urban/rural difference in infection rates continues.

W.G.0.27 SENTINEL SITE SURVEILLANCE FOR AIDS IN ABIDJAN, COTE D'IVOIRE

De Cock, Kevin M.*; Porter, A.*; Moreau, J.*; Diaby, L.*; Odehouri, K.*; Heyward, W.**; et al.
*Projet RETRO-CI, Abidjan, Cote d'Ivoire; **AIDS Program, Centers for Disease Control, Atlanta, GA., USA.

Objective. To characterize patients with AIDS, to determine the frequency of HIV-1 and HIV-2 infections in AIDS patients, and to estimate the minimum incidence of AIDS in Abidjan.

Methods. Consecutive adult medical admissions to Abidjan's two largest hospitals, HA and HB, were assessed (clinically and serologically for HIV-1 and HIV-2 infections) over periods of 84 (HA) and 38 days (HB), respectively. Patients were diagnosed as AIDS if HIV+ and meeting the WHO or CDC case definition. Hospital and mortuary records were examined in HA to assess mortality. Extrapolations were made from rates observed to calculate minimum AIDS incidence by age, sex and district.

Results. 269 HIV confirmed AIDS cases were identified among 1501 patients. The M:F ratio of AIDS cases was 4.6:1, increasing from 1.5:1 (15-19 years), to 18.5:1 (50 years +). AIDS accounted for 20% and 7% respectively of medical admissions to HA and HB, and for 33% of medical deaths in HA. Minimum incidence for AIDS in men in Abidjan is 1414 cases/million/year, and in women 353 cases/million/year. Highest rates are found in men aged 30+ years (>2000/million/year) and in women 30-39 years (769 cases/million/year). In 4/10 districts, minimum AIDS incidence is >1200 cases/million/year. Peptide ELISA and Western blot results for HIV-1 and HIV-2 show that HIV-1 is the predominant cause of AIDS in Abidjan.

Conclusion. AIDS is epidemic in this West African city and a significant cause of mortality.

W.G.0.28 LES ASPECTS EPIDEMIOLOGIQUES DES AFFECTIONS LIEES AUX VIH1 ET 2 EN REPUBLIQUE CENTRAFRICAINE.

P.Somse####, A.J.Georges##, R.M.Siopathis#, J.A.Vohito###, J.C.Bouquety#, M.D.Vohito#.
Centre National Hospitalier, BP 934, Bangui, CAR; ## Institut Pasteur, BP 923, Bangui, CAR; ###Laboratoire National de Santé Publique, BP 934, Bangui CAR; #### Programme National de Lutte contre le SIDA, BP 883, Bangui, CAR.

La situation de la République Centrafricaine dans une sous-région où sévit avec acuité le SIDA nécessite de la part des autorités du pays et des organes de lutte contre le SIDA une surveillance épidémiologique soutenue. Les données qui sont rapportées concernent essentiellement la capitale (Bangui) et proviennent du Laboratoire National de Biologie Clinique, de la Banque de sang, de l'Institut Pasteur de Bangui, de la Faculté de Médecine et du Bureau de Coordination du Projet SIDA. Le nombre déclaré de cas de SIDA est passé de 432 en Juin 1988 à 521 (520 VIH1, 1 VIH2) en Décembre 1988. Il s'agit presque exclusivement d'affections à VIH1.

La séroprevalence chez les donneurs de sang est de 8% pour VIH1 et de 0% pour VIH2. VIH2 a été mis en évidence chez 5 sujets seulement (1 SIDA, 4 porteurs sains). La prévalence chez les femmes enceintes est de 5,5% ± 0,8% . Des enquêtes non randomisées menées chez les prostituées ont montré un taux de séropositivé VIH1 de 25% sans séropositivité VIH2. Les enquêtes épidémiologiques au sein de la population générale agée de 15 à 45 ans à Bangui ont montré une évolution de la prévalence (porteurs sains) de VIH1 de 2,3% en 1985, à 4,02% en 1986 et à 7,8% en 1987.

W.G.0.29 COMPARISON OF THE AGE DISTRIBUTION OF ANTI-HIV-1 AND ANTI-HBc IN AN URBAN POPULATION FROM MALAWI

Liomba, N.G., Gürtler, L., Eberle, J., Ntaba, H.M., Deinhardt, F., Rehle, T.
* Queen Elizabeth Central Hospital, Blantyre, Malawi
** Max von Pettenkofer Institute, University of Muenchen, FRG
*** Gesellschaft für technische Zusammenarbeit, Eschborn, FRG

Objective. Comparing the prevalence of HIV to Hepatitis B Virus (HBV) in different age groups and different years we tried to determine the time of introduction of HIV in Malawi.

Methods. Anti-HIV was determined by ELISA, immunofluorescence and immunoblot. Anti-HBc was determined by RIA.

Patients. Antenatal women and patients from the medical wards of two hospitals in Blantyre and Lilongwe.

Results. Numbers and percentages are given in the table. Males were more affected.

	1987			1988		
Age	anti-HIV	anti-HBc	no. of patients	anti-HIV	anti-HBc	no. of patients
0-19	14 %	41 %	102	18 %	44 %	39
20-39	26 %	57 %	203	28 %	52 %	221
40-49	14 %	58 %	35	4 %	63 %	27
>50	6 %	72 %	68	16 %	85 %	39

Conclusion. In contrast to the prevalence of anti-HBc which increased continuously with age, anti-HIV was only present in few individuals of 40 years or older. This cannot be explained solely by the mortality of the HIV-infection but rather indicates that HIV was introduced only recently.

W.G.0.30 HIV, HTLV-I and HBV INFECTION IN PREGNANT WOMEN FROM AN URBAN POPULATION IN ZAIRE

Kashala, Oscar*; Lomami, L.**; Ngalula, K.**; Kanki, P.*; Kalengayi, M.**; Essex, M.*; et al. *Harvard School of Public Health, Boston, MA, USA; **University of Kinshasa, Kinshasa, Zaire

HIV and HBV infections are endemic in some urban populations of Zaire. We have investigated the HBV, HIV and HTLV-I status of pregnant women attending an ante-natal clinic of the Kinshasa University Hospital (KUH), for evidence of maternal-child transmission of these viruses.

Methods: 508 pregnant women who attended the KUH during a six month period (June to December 1988) were analyzed for HIV, HBV and HTLV-I infection. Serum samples were collected from all pregnant women who did not have symptoms suggestive of AIDS or related conditions were tested for HIV-1, HIV-2 and HTLV-I by Western blot. HBV markers were tested in 223 women. HBsAg, anti-HBs and anti-HBc antibodies were determined by commercial ELISA (Abbott).

Results: Of 508 women tested for HIV infection, 19 (3.76%) were positive for HIV-1 and none were positive for either HIV-2 or HTLV-I (0%). Of 223 women tested for HBV infection, 158 (70.85%) had at least one HBV marker. HBs was found in 46 individuals (20.62%) in association with other HBV markers or alone (50%). In 28.3% of cases, HBs was found in association with anti-HBc. Anti-HBs was detected in 50% of the women. Anti-HBc was detected in 65% of the women and anti-HBc alone in 10.71% of cases.

Conclusions: It appears that only 3.76% of pregnant women attending our hospital have antibodies to HIV-1 this is in contrast to 18% of pregnant women reported previously at Mama Yemo Hospital. The discrepancy is marked and indicates local variations in HIV prevalence rates in individuals as well as hospitals from the same city. Unlike HIV, HBV infection is very common and the HBs seroprevalence exceeds that of the general population (20.62% vs. 5.7%, p<0.01). Therefore, screening programs for HBV are strongly recommended to reduce the risk of perinatal transmission.

Atelier régional : Afrique occidentale
Regional Workshop: West Africa

W.G.0.31

THE HIV PROBLEMS IN WEST AFRICA FEMI SOYINKA, OBAFEMI AWOLOWO UNIVERSITY, ILE-IFE, NIGERIA.

Various studies in West Africa have shown that the prevalence of HIV and AIDS vary signiffcantly from country to country. Eventhough data arising from countries are inadequate there are indications that HIV posses a threat to West Africa. The most frequently studied groups are prostitutes, STD patients and blood donors where prevalence rates are high. Perinatal transmission of HIV is also reaching alarming dimension. Blood Transfussion induced AIDS - especially among sicklers, cultural related HIV transmission (e.g. medicinal tattoos, traditional blood letting, and polygamous practices) have not been adequately addressed in West Africa. The emergence of HIV-2 in West Africa around 1985 has generated a lot of scientific and political controversies. HIV-2 may be more prevalent in many West African countries than hitherto recorded. A better understanding of the clinical and immunological implication of infection through HIV-2 is needed through systematic epidemiological and clinico-pathological research. Clinical cases of HIV-1 infection do not differ much in West Africa, from other countries. The prevalence of particular pathogens might make for the differences. Clinical oriented surveillance is more needed in African countries where lack of laboratory facilities, and financial limitations prevail. Operational problems in respect of HIV research include scarce resources, and inadequate flow of information among African researchers. International effort can maintain the information flow to developing countries. AIDS programme should be integrated into existing health care organisations such as the MCH, PHC and STD. What is essentially important about AIDS in Africa is the enormity of the problems and the failure to accept this.

AIDS AND TOURISM

Taitt, Branford. Ministry of Health, St. Michael, Barbados.

W.G.0.38

FREEDOM OF INTERNATIONAL TRAVEL. MOONEY, Terry, WHO Global Programme on AIDS, World Health Organization, Geneva, Switzerland.

Objective: To describe the detrimental consequences of mis-guided attempts to stop the spread of HIV infection by restricting the freedom of international travel, and to explain the public health and human rights rationale of the endorsement of freedom of movement in the Global AIDS Strategy.
Methods: Three criteria are applied to analyse restrictions on international travel. the first one is the public health rationale, where restrictions are evaluated against the requirements for the promotion and protection of public health. The second criterion is international human rights law. This necessitates the assessment of compatibility of restrictions on international travel with the principle of freedom of movement, and with detailed provisions concerning the rights of seamen, refugees, migrant workers; aliens, migrants and travellers in general. The third criterion is cost/benefit analysis. Firstly, the financial implication of the implementation of various restrictions is analysed to determine the justifiability of restrictions from the viewpoint of resource allocation in the AIDS strategy. Secondly, the opportunity cost - both financial and social - is added.
Results: It is shown that restrictions on international travel are not effective in the prevention of the spread of infection, nor consistent with international human rights law, nor justified by the criterion of financial an opportunity cost these restrictions involve.
Conclusion: Alternatives to the ineffective, unnecessary and unjust restrictions are not only possible in theory but have proved feasible in practice. Examples include information and education programmes developed by international development agencies, trade unions and also ministries of health. AIDS strategies which are consistent with both public health and human rights rationale has also demonstrated good financial and social cost/benefit ratio.

W.G.0.39

LE SIDA ET LES VOYAGEURS: PERSPECTIVES EN SANTE PUBLIQUE
Michel CAYEMITTES, MD / Institut Haitien de l'Enfance

Sil etait concevable au debut de l'epidemie du SIDA que certains pays non encore touches aient voulu proteger leur territoire contre la penetration du virus par le controle des voyageurs, il apparait que ceci est actuellement un leurre, compte tenu des caracteristiques actuels de l'epidemie.

En effet quasiment tous les pays ont chacun leur foyer epidemique susceptible de favoriser "in situ" la propagation de la maladie. Par ailleurs la negativite des tests de depistage des voyageurs penetrant un nouveau territoire ne garantit pas que certains ne sont pas contamines, de plus ce depistage necessiterait une mobilisation enorme de ressources et est complexe a bien des points de vue. Ce depistage systematique n'est pas necessairement conforme a l'ethique medicale.

Avec le caractere explosif de la pandemie du SIDA et le brassage des populations du globe il est fort probable neanmoins que le nombre de voyageurs porteurs du virus VIH augmentera avec le temps. Face a cette perspective il est necessaire que les agences de voyage, les transporteurs internationaux s'engagent fermement dans une campagne continue d'information education des voyageurs sur la prevention du SIDA. De meme tous les points d'arrivee et les hotels devraient avoir des centres d'information et de distribution de materiel de prevention a l'intention des voyageurs.

W.G.0.40

SIDA: CONSEILS AUX VOYAGEURS
ROBERT,Jean. Département de Santé communautaire, Hôpital Saint-Luc,Montréal,Québec.Canada

Plusieurs voyageurs s'inquiètent des risques de transmission du virus HIV durant leur voyage ou séjour à l'étranger. Plusieurs autres ne s'en préoccupent même pas, mais peut-être le devraient-ils?Le virus est présent partout dans le monde et les modes de transmission sont toujours les mêmes. En voyage c'est le comportement qui change à l'occasion du dépaysement...on peut voyager dans son propre pays et voir ses bonnes intentions fondre au soleil. Quatre volets nous concernent: A) les pays qui, pour des raisons politico-sanitaires ont, des exigences quant à la séro-négativité HIV ou interdisent l'entrée de médicaments; B) les voyageurs séro-négatifs ou présumés tels; C) les personnes séro-positives ou présumées telles; D) les personnes sidéennes en période de rémission. Il sera question des mesures vaccinales, de la chimioprophylaxie, des règles complémentaires d'hygiène, d'une éventuelle discrimination ou de certaines limites dans les lieux et les types de voyage.

SIDA et tuberculose
AIDS and Tuberculosis

Th.G.0.1

AIDS AND TUBERCULOSIS (TB) IN THE USA

Braun, M. Miles; Heyward, W; Ciesielski, C.; Berkelman, R. Byers, R.; Bloch, A.
Centers for Disease Control (CDC), Atlanta, GA, USA

Objective. To compare AIDS patients with and without TB and identify risk factors for TB in AIDS patients.
Methods. Using logistic regression, we analyzed all AIDS cases reported to CDC from September 1, 1987 (when the CDC AIDS case definition was revised to include extrapulmonary TB with lab evidence for HIV) through January 9, 1989.
Results. Of 40,366 AIDS cases, 1001 (2.5%) had extrapulmonary TB. TB was diagnosed definitively in 893, presumptively in 108. AIDS patients with TB (AIDS/TB) did not differ by age from AIDS patients without TB. AIDS/TB comprised 3.1% of female AIDS patients vs 2.4% for males (p=.003). TB was reported in 1.3% of whites with AIDS, 4.7% of blacks, and 2.6% of hispanics (p<.001). Of AIDS patients, 771 (2.3%) of US origin had TB, compared to 20 (7.3%) Mexicans, and 71 (13.0%) Haitians (p<.001). TB was reported in 4.4% of heterosexual intravenous drug users with AIDS, 1.4% of homo/bisexual men, and 5.4% of those with heterosexual contact as their AIDS risk factor (p<.001). In 55% of AIDS/TB patients, TB was the sole opportunistic infection (OI) reported; the most common additional OI was *Pneumocystis carinii* pneumonia.
Conclusion. The 2.5% rate of TB in US AIDS patients should be considered an underestimate, because pulmonary TB is not counted in the case definition and because diseases occurring after the initial diagnosis of AIDS may not be reported. Significant variations in TB rates are associated with sex, race, national origin, and risk group. TB needs to be considered in all AIDS patients, particularly those with pneumonia.

Th.G.0.2

EFFECT OF TUBERCULOSIS INFECTION AS A NEW AIDS DEFINITION CRITERIA ON SURVEILLANCE DATA

Casabona J(CE), Guiu J, Bosch A and Segura A. (AIDS Program. Generalitat de Catalunya. Barcelona, Spain).

Objectives : 1.- To quantify possible changes on the prevalence and incidence of AIDS due to the introduction of the new CDC definition criteria in the catalan surveillance system. 2.- To identify the more frequent condition among the new definition criteria. 3.- To describe the subpopulation more sensitive to the new definition.
Methods: Data from the population-based AIDS registry of Catalonia were used. The registry systematically collects information on all patients with AIDS diagnosed in Catalonia, covering a population of about 6 million hab. and using a hospital based active surveillance system. The 1987 CDC case definition criteria were introduced for surveillance purposes in January 1988.
Results: Up to december the 31st of 1988, 555 cases meeting the old definition criteria and 209 meeting the new definition were reported. The use of the new definition increased the cumulative period prevalence from 92.5 to 127.3 per million hab. (37.6% increment), and it increased the incidence during 1988 from 34.3 to 63.0 per million hab. and year (79% increment). Among cases meeting the new definition criteria 85 (40.7%) presented with some clinical form of extrapulmonar M. tuberculosis infection (E.Tbc.) as the only inclusion criteria, 48 (23%) with an E.Tbc. in association with another opportunistic disease and 76 (36.3%) had inclusion criteria other than tuberculosis. Table 1 shows the transmission categorie distribution of each group.

TABLE 1:

TRANSMISSION GROUP	ALL CASES (764)	NEW DEFINITION CASES (209)	M TUBERCULOSIS ONLY (85)
IVDU	462 (60.5%)	158 (75.5%)	73 (85.8%)
Homosexual men	221 (28.9%)	30 (14.3%)	10 (11.7%)
Heterosexual	22 (2.8%)	7 (3.3%)	2 (2.3%)
Transfusional	5 (0.7%)	2 (0.9%)	-
Blood products	20 (2.6%)	4 (1.9%)	-
Vertical	19 (2.5%)	5 (2.3%)	-
Transplant	1 (0.1%)	-	-
Unknown	14 (1.8%)	3 (1.4%)	-

Conclusions: To evaluate the impact of the new definition criteria it is necessary to use incidence vs. prevalence data. In our population extrapulmonar tuberculosis account for the majority of cases reported because the new definition. New criteria will probably be more sensitive to IVDU men between 25 and 35 years old.

Th.G.0.3

TUBERCULOSIS AND AIDS: OUR EXPERIENCE.

Dres. Benetucci J, Astarloa L, Gonzalez Montaner J, Abbate E, da Bouza J, Compagnucci A, Corti M and Bases O.
AIDS Unit and Tisiology Division. Hospital F.J.Muñiz. Buenos Aires. Argentina.

OBJECTIVE: Underline the frecuency of the TB as an opportunistic infection, the seriosness of the injuries and the low incidence of the atypical mycobacteria in patients with HIV infections in Argentine.
METHODS: Between January 1986 and July 1988 we studied 17 patients with TB among 81 patients with AIDS (16 were males and 1 was female). Age rank 15 to 48 years. There were 5 heterosexual IVDA, 9 homosexual, 4 bisexual and 1 was an hemophilic A with multiple blood transfusions. All of them were HIV serology by ELISA and WESTERN-BLOT positive. RESULTS: In 2 patients there were diffuse pulmonary infiltrates, 7 with pulmonary cavities, 4 with pleural effusions (1 of them with ascitis), 3 with peripheral adenopathies (1 of them mediastinal involvement) and 1 genitourinary and meningeal involvement. In 14 we obtain culture positive for M. tuberculosis (9 from sputum, 1 from adenopathy, 1 bronchial washing, 1 pleural effusion and 1 blood culture) and in 3 we have histophatological result compatible (2 adenopathies biopsies and 1 pleural biopsy) Nine patients responded to specific treatment (2HRSZ, 7HR), 5 died and 3 are in treatment. We have not had atypical mycobacteria. The TB lesions in our patients are of customary characteristic but of greater extension and cavitation than with non-AIDS patients.
CONCLUSION: TB were founded in 21% of AIDS patients as an opportunistic infection. We have not had atypical mycobacteria. In this context of whatever specimen of acid-fast bacilli must be considered as tuberculosis and treated as such. The TB lesions are greater extension and cavitation than with non-AIDS patients.

Th.G.0.4

THE IMPACT OF HUMAN IMMUNODEFICIENCY VIRUS (HIV) ON TUBERCULOSIS IN ZAMBIA: A CROSS-SECTIONAL STUDY.

Elliott, Alison*; Luo N*; Tembo G*; Steenbergen, G**; Nunn, P***; McAdam K*** et al.
*University Teaching Hospital, Lusaka, Zambia. **Ministry of Health, Lusaka, Zambia ***London School of Hygiene and Tropical Medicine, London, UK

Objective To study the impact of HIV on tuberculosis in Zambia.
Methods From November 1988 to January 1989 we have carried out a study of 300 outpatients on anti-tuberculous therapy in Lusaka, to be compared with smaller samples from 2 rural centres. The prevalence of HIV antibody, detected by Wellcozyme ELISA and confirmed by Dupont, among these patients is compared with that found in age- and sex-matched blood donors.
Results Preliminary results on the first 190 patients are as follows

Site of tuberculosis	number of patients	seropositivity (%)
Confirmed pulmonary	69	39 %
Suspected pulmonary	64	59 %
Pleural	31	81 %
Pericardial	8	88 %
Lymph node	8	88 %
Other	8	50 %

When the study code is broken further data analyses will be available.
Discussion Tuberculosis is emerging as the major bacterial pathogen in patients infected with HIV in Central Africa. It is both common and treatable. But new questions arise regarding the management of tuberculosis when it occurs in association with HIV. Current data from this study will be presented directed at guiding further investigation of these issues.

Th.G.0.5

A STUDY OF HIV INFECTION IN ASSOCIATION WITH TUBERCULOSIS PATIENTS SEEN IN INFECTIOUS DISEASES HOSPITAL (IDH) NAIROBI

DANIEL K. KIBUGA*, S.M. Gathua**, P. Nunn***
*Senior Medical Officer, IDH, **Chest Physician, IDH,
***Physician, London School of Tropical Medicine & Hygiene.
¶INFECTIOUS DISEASES HOSPITAL, NAIROBI, KENYA

Objective: Assess prevalence of HIV infection and associated complications in TB patients seen in I.D.H. between January 1987 - June 1988.
Method: A total of 656 patients were HIV screened mainly by organon technique and western blot confirmation when available and various aspects of HIV positive patients compared with randomly selected seronegatives marched by age and sex.
Results: 105 HIV seropositives were seen. Extrapulmonary disease was 17% in HIV +ve against 5.5% in HIV -ve and mortality despite effective chemotherapy was threefold in seropositives by the end of the 3rd month of treatment. There was no association between HIV positivity and drug resistant strains. The incidence of severe drug reaction in HIV seropositives was about five fold.

HIV Related complications	+ve	-ve	HIV related complications	+ve	-ve
Diarrhoea	39	1	Herpes zoster	3	0
Wt. loss on chemotherapy	56	8	Mental confusion	4	0
Oral thrush	28	1	Scabies	3	0
Pleuritic dermatitis	17	1	Karposis sarcoma	1	0
Generalised lymphadenopathy	14	1	Chicken Pox	1	0
Allergic drug reaction	27	5			

Conclusion: Tuberculosis control programme in Kenya is facing serious challenge due to rising HIV infection.

Th.G.0.6

ASSOCIATION OF TUBERCULOSIS AND HIV INFECTION IN ZIMBABWE

*Legg, William; Mahari M; Houston S; Neill P; Ray C S; Marowa, E. *City Health Department, Harare, Zimbabwe.

RATIONALE: Tuberculosis (TB), a common, treatable, and transmissable complication of HIV infection, is presently increasing in Zimbabwe.
OBJECTIVES: 1) To determine the seroprevalence of HIV in TB patients. 2) To compare the features of TB in seropositive and seronegative patients.
METHODS: From July to December 1988, all patients diagnosed as TB in the Harare City TB Unit were studied. Full clinical assessment and HIV testing using ELISA, in some cases confirmed by Western Blot, was performed.
RESULTS: Total TB diagnoses 447; 252 proven bacteriologically or histologically, 195 diagnosed clinically. HIV serology was obtained in 403 (90%).

Seropositivity by age group:

≤2yrs.	3-15 years	16-40 years	40 years	Total
52% (n=29)	*12% (n=17)	43% (n=243)	17% (n=114)	33.7% (n=403)

*both 15 year old females

HIV-positivity by sex in 16-40 age group: Men 43% (n=173), Women 43% (n=70)
Significant (p<.01) differences between HIV + and HIV - TB patients (16-40)

	Mantoux ≤5mm	≥2 organs	sputum AFB+	Adenitis	Hilar LN	Cavities
HIV +	35 (43%)	17 (16%)	50 (54%)	10 (9.5%)	18 (19%)	30 (32%)
HIV -	25 (23%)	4 (2%)	97 (75%)	1 (0.6%)	9 (6.9%)	69 (53%)

No significant difference: symptom duration, previous TB history, pleural TB, extrapulmonary TB other than adenitis. Too few cases to assess significant difference: miliary TB (10), TB Pericarditis (6), TB meningitis (2).

Of seropositive patients, 82 (78%) had other clinical feature of HIV infection (chronic diarrhoea, PGL, oral thrush, or zoster),

Recherches sur la sexualité humaine
Human Sexuality Research

Th.G.0.7 "Reliability and Validity Issues in the Assessment of Sexual Behavior."

Catania, Joseph A., Ph.D.
University of California, San Francisco
San Francisco, California, USA

An unprecedented number of human sexuality studies have been initiated in response to the AIDS epidemic. Unfortunately, methodological developments in the field of sex research have been slow in meeting the demands of AIDS investigations focusing on the diverse populations at risk for HIV (e.g., adolescents, gay men, IV-drug users, ethnic minorities, elderly transfusees). This paper reviews and integrates literature on response bias in sex research. The relevance of past methodological findings for AIDS behavioral research is discussed and recommendations are made to guide future investigations on sexual behavior in the area of AIDS.

Th.G.0.8

SEXUALITY RESEARCH IN ZAIRE

Lusakulira, Namagosi, Kinshsa, Zaire

Th.G.0.9 SEXUALITY RESEARCH CONCERNING STD AND AIDS IN THAILAND

Verasit Sittitrai, Jean Barry
Chulalongkorn University, Bangkok, Thailand

Object To examine status of research on sexuality concerning sexually transmitted diseases and AIDS in Thailand and recommend areas of research needs.
Method Compilation of bibliography. Review of available literature and existing data.
Results Systematic research on human sexuality in Thailand was primarily carried out during the past two decades. Most of earlier research was done in relation to contraceptives and birth control. Later, clinical STD research and research on premarital sex of adolescents received most attention. Research efforts have covered areas: sexual behaviours, marriage, sex education, knowledge, attitude and beliefs concerning sex and sexual health. Inquiry of KAP among adolescents on sexual experience and STDs is rather thorough, however, among adults is limited and fragmented.
Conclusion sexual research in Thailand covers vast areas but not indepth. Needed are psychosocial studies on sexuality including description of sexual behaviours and cultural traditions among various groups of the total population.

Th.G.0.10 SEXUALITY RESEARCH IN BRAZIL

Pinel, Arletty*
*Centro de Referência e Treinamento-AIDS, São Paulo Brazil

Brazil is usually associated to Carnival (Mardi-Gras), music, Latin lovers and half-naked "mulatas" that crowd the beaches in Copacabana. But the true Brazil is more than the apparent sexual permissiveness of less than 10% of the population. Its size, as well as, its economic situation and mixed racial and cultural origins, bring about a unique and complex country of fascinating contrasts. "Active" and "passive" sexual behavior have a greater significance in the general population than the concepts of heterosexuality, bisexuality and homosexuality . Sex plays an important role in the Afro-Brazilian cults that are widely practiced by Brazilians. Women are expected to be submissive to men. Transvestite prostitution is an important form of prostitution. Homosexuality is still considered a form of disease or a sin. Sex can be practiced for procreation, recreation or survival. Research in sexuality has to have the flexibility to to distinguish the difference between sexual and sensuous behavior which, in Brazil, have distinct meanings.

Th.G.0.11 RESEARCH ON HUMAN SEXUALITY IN SUB SAHARAN AFRICA

Adeokun, Lawrence A.*
*Global Programme on AIDS, WHO, Geneva, Switzerland

Objective: The presentation provides a sociocultural framework within which African sexuality and the risk of HIV infection can be investigated.
Method: Ethnographic materials and some preliminary findings from WHO-supported national studies are presented. A life cycle approach is adopted in the discussion to reflect variations by age, sex and social status.
Results: There is greater structural control of female than of male sexuality. Lactational abstinence remains the most effective control on marital sexuality. Marriage and sexual intercourse are ruled out between a large proportion of adults. However, marital instability exposes the reproductive sexual network to the wider recreational network. The concepts of beauty, erotism and sexual obligations are passed on from one generation to another within the framework of puberty rites and at fertility-related festivals. Sexuality in old age is influenced by the socio-economic independence of both sexes at the end of the female reproductive cycle and tends to involve younger persons. Education, migration and urbanization erode traditional sexual mores. Clustering of young adults, mostly males, in urban centers and on plantations produces a compensatory inflow of females who provide them with a range of domestic, commercial and sexual services on a regular or ad hoc basis. Implications for HIV transmission are stressed.
Conclusion: A systematic research agenda is needed to increase our understanding of the social dynamics of heterosexual transmission and control of HIV/AIDS in Africa.

Th.G.0.13

HETEROSEXUAL TRANSMISSION OF HUMAN IMMUNODEFICIENCY VIRUS: THE PAST AND THE FUTURE. J.O. NDINYA-ACHOLA, UNIVER. NAIROBI.

OBJECTIVES: To review the history of heterosexual transmission of HIV in Africa and the rest of the world; to assess the current status of heterosexually transmitted HIV, the woemn at risk, and the morbidity and mortality associated; and to review options available for protecting the women at risk.

Human Immunodeficiency virus has been circulating in various world populations since the seventies. Although clinical illness was only recognised at the beginning of the eighties decade, varying number of individuals were infected in mid to late seventies but were assymptomatic.

Heterosexual transmission first recognised in Africa and the Carribean where M:F ratio of HIV infected individuals was approximately 1:1 is an important mode of transmission of HIV throughout pattern 2 countries. It is increasing in pattern 1 countries and is likely to take root in pattern 3 countries.

In Africa high rates of infection (30-90%) has been demonstrated in highly promiscous groups of women (prostitutes). Heterosexual transmission has also been associated with women in the age group 20-40 years who are either living with their infected husbands or have had multiple marriages. Infection rate among teenage girls is still low(less than 1%).

Apart from mortality associated with HIV infection, studies also indicate that HIV infection leads to poor obstetric outcome (low birthweight, prematurity intra-uterine death. Risk of transmission to the foetus is about 25-30%.

CONCLUSION: It is proposed that in countries where heterosexual transmission is high health education targetted at the identified women at risk should be stepped up. Condom promotion activites along with change in sexual behaviour and attitudes should be part of the message. Research in locally acting virucidal agents for use during sexual intercourse should be intensified.

Th.G.0.15

WOMEN AT RISK - RESEARCH NEEDS AND PRIORITIES

LATIF A.S. UNIVERSITY OF ZIMBABWE MEDICAL SCHOOL, HARARE, ZIMBABWE

Sexual intercourse between men and women is the chief mode of transmission of HIV in Africa. Other modes of transmission include the infusion of infected blood and blood products, vertical transmission between mother and foetus, parenteral drug abuse, unprotected sexual intercourse between homosexual men. The role of biting insects in the transmission of HIV has not been reported. Other possible modes of transmission include ritual practices involving shart instruments used for scarification and circumcision and the ingestion of infected breast milk by neonates. Distribution by age of subjects with HIV infection in Africa shows a brimodal pattern with a peak below the age of 5 years and another in the group aged between 25 and 40 years. Prostitution and prostitute contact are well recognised as risk factors for HIV seropositivity. The role of genital ulcers in the acquisition and transmission of HIV have been demonstrated in some studies.

Studies need to be carried out to elucidate the following points:-
The role of breast milk in the transmission of HIV, the role of pregnancy in worsening the clinical progress of women with HIV infection, the role of male circumcision in the acquisition and transmission of HIV, and the role of intervention programmes among high risk groups in the reduction of the spread of HIV infection. Other socio-behavioural studies need also to be carried out.

PROGRAMMATIC IMPLICATIONS

Meheus, André. Organisation Mondiale de la Santé Genève, Suisse.

Th.G.0.14

POPULATION ATTRIBUTABLE RISK OF SEXUALLY TRANSMITTED DISEASES (STDs) IN HIV INFECTION

Seth Berkley. Uganda Ministry of Health and The Task Force for Child Survival, Entebbe, Uganda.

The presence of STDs have been consistently associated with an increased risk of HIV transmission in studies that control for potential confounding. In selected populations, relative risks for HIV infection have ranged between 1.5-20 in persons with STDs, particularly genital ulcers, compared to persons without. Such strong associations, however, give little information as to the public health significance of this interaction for the population. A risk factor which is associated with a high relative risk but which is relatively rare, may play only a small role in community transmission of the infection. Population attributable risk (PAR) is a measure both of strength of association and risk factor prevalence and theoretically defines the fraction of disease that would be eliminated if the risk factor could be removed from the population. Prospective studies in high risk groups in Africa have shown attributable risks for various STDs of 0.2-0.3; population based surveys with retrospective self-reported STD data have suggested lower PARs. As STDs are hyperendemic in many parts of Africa, STD control may play an important role in reducing HIV transmission. Further population based studies are necessary to define the PAR of the HIV/STD interaction to understand the potential impact of STD control in halting the spread of the HIV epidemic

Th.G.0.16

A DESCRIPTION OF NATIONAL STD CONTROL PROGRAM

Hira, Subhash
University Teaching Hospital, Lusaka, Zambia.

In Zambia, 5.0% of all outpatient attendances are related to sexually transmitted diseases (STD) and is third common cause for patient attendances at health institutions. Zambia is the only sub-saharan African nation with a national STD control program. It was launched in 1980 with following main objectives: 1. to assess extent and nature of STD; 2. to improve management of STD so as to reduce its complications; 3. establishemnt of network of STD clinics at provincial and district levels; 4. increase public awareness; 5. coordinate research, treatment and preventive activities to reduce the incidence. The program has expanded to include 38 STD clinics providing standardized treatment, contact tracing, counselling and surveillance. The male:female attendance ratio has improved from 5:1 in 1980 to 2:1 in 1987. The prenatal syphilis screening and treatment program introduced in 1984 has reduced seroprevalence of syphilis in pregnant women in Lusaka from 12.8% in 1983 to 8.0% in 1987.

With high seroprevalence of HIV-1 among STD attendees, it is single, easily assessable target population for education for prevention and condom promotion. Also, these clinics will now function as outpatient service units for HIV-infected patients.

Conclusion. Other nations can benefit from this model program.

Th.G.0.18

Défis posés par la gestion de programmes
Challenge of Programme Management

Th.G.O.19

THE WHO'S CONCEPT OF NATIONAL AIDS PROGRAMME MANAGEMENT

Tarantola, Dr D., World Health Organization, Switzerland.

As the World Health Organization extended its cooperation to over 118 national AIDS programmes in 1987-1989, and as the resources available for these programmes and the number of participating groups and individuals grew, the WHO's concept of AIDS programme design and management adapted itself to the fast evolving environment. The sequence of programme development steps had to be altered so as to create opportunities for other participants, both from government sectors and NGOs, to play an active role in the creation, implementation and evaluation of national programmes. This, in turn, enabled WHO to gradually focus its technical and financial collaboration with countries. Critical issues faced today, which will be addressed in this presentation, include programme sustainability, the challenge of coordination, the need for many countries to create or strengthen medical and social support to those affected, the compelling necessity to keep AIDS programmes fully integrated with other existing health and social institutions, the critical involvement of NGOs/PVOs in national programmes and the concurrent process of decentralization of activities, resources and responsibilities. Developing countries which embarked on large scale programmes in 1987-1988 are now assessing their performance. An account of the main outcome of these evaluation activities will be given.

Th.G.0.25 PROSPECTIVE STUDIES ON HIV INFECTION OF PROSTITUTES IN THE PHILIPPINES

Hayes, Curtis*; Manaloto, C.*; Padre, L.*; Basaca-Sevilla, V**; Andrada, A.***; Espinosa, G.***; et al.
*U.S. Naval Medical Research Unit #2, Manila;**Philippine Department of Health, Manila; and ***The City Health Office, Olongapo, Republic of the Philippines.

Objective. Describe the epidemiology of new HIV infections occurring in prostitutes over a 4-year period.
Methods. Hospitality girls working in bars and night clubs frequently engage in prostitution in the Philippines. We have prospectively sampled populations of these women in several towns to determine HIV incidence based on seroconversions. In addition, other women who entered the study populations and started working between bleeding intervals were tested. HIV positive women have been interviewed and examined clinically at 3-month intervals since their diagnosis.
Results. HIV seroconversions have been documented in 14 of 12,615 prostitutes for an incidence rate of 0.9/1000 person years. An additional 22 HIV positives were detected among 25,473 women who entered the target populations between bleedings. The number of new HIV positives detected each year appears to be decreasing. Only minor signs and symptoms that are probably HIV related have been detected after an average follow-up of 17 months.
Conclusion. This study documents a low rate of HIV spread among the prostitute populations sampled. Based on interview data, this may be attributable to certain sexual behavior characteristics and to the absence of IV drug use.

Th.G.0.27 MALE CIRCUMCISION IN EASTERN AND SOUTHERN AFRICA: ASSOCIATION WITH HIV SEROPREVALENCE

Moses, Stephen*, Plummer, F.A.**, Ronald, A.R.***, Ndinya-Achola, J.O.**.
*International Development Research Centre, Nairobi, Kenya; **University of Nairobi, Nairobi, Kenya; ***University of Manitoba, Winnipeg, Canada.

OBJECTIVE: To investigate the association between male circumcision and the geographical pattern of HIV infection in eastern and southern Africa.
METHOD: Several cross-sectional and prospective studies have shown uncircumcised men to be at higher risk of HIV infection compared to circumcised men. We searched an anthropological data base to ascertain the practice of male circumcision among major ethnic groups in eastern and southern Africa, and reviewed population-based HIV seroprevalence data.
RESULTS: Approximately 15% of the male population in Kenya (2 major ethnic groups/30) is uncircumcised, as compared to 60% in Tanzania (13/28), 80% in Zambia (7/9), 90% in Uganda (12/13), and 90% in Zimbabwe (8/9). A preliminary review of published and unpublished data yielded population-based HIV seroprevalence data from over 30 areas in the region, which were divided into low, moderate and high HIV prevalence. Ethnic groups in high and moderate prevalence areas were more likely to be uncircumcised compared to those groups in low prevalence areas.
CONCLUSION: Preliminary findings suggest that the geographical patterns of HIV seroprevalence are consistent with the hypothesis that uncircumcised men are at higher risk of acquiring HIV infection. Further studies examining the relationship between male circumcision and the risk of acquiring HIV infection are recommended.

Th.G.0.29 CONDOM USE AND KNOWLEDGE IN GENERAL POPULATION, FEMALE PROSTITUTES AND GAY AND BISEXUAL MEN.

Izazola JA*, Pineda L*, Valdespino JL*, Sepulveda J.*
*Directorate of Epidemiology. Ministry of Health. Mexico

Objective. To compare knowledge and use of condom in general population, prostitutes and homo and bisexual men.
Method. A survey was done in 6 cities in Mexico during May,1988. A questionnaire was applied individually to general population (n=631), female prostitutes (n=796) and homo and bisexual men (n=716); a condom was shown to investigate visual recognition and condom use practices.
Results.

Knowledge and use of condom.

	Knows	Used last m.	Used last 6m.
Gen.pop.	78%	8%	10%
Homo.	96%	25%	43%
Prost.	94%	53%	58%

Frequency of use of condom during the last 6 months

	Always	Half of the time	Never
Gen. pop.	5%	5%	90%
Homo.	29%	14%	57%
Prost.	38%	20%	42%

A significant difference existed between every group.
Conclusion. The use of condom is less frequent in gay men than in prostitutes although their knowledge is similar. The use of condom is more frequent in gay men than in general population which is explained by their risky practices.

Th.G.0.26 STATUT SEROLOGIQUE D'UNE POPULATION DE PROSTITUEES DOUBLEMENT EXPOSEES AUX HIV1 ET HIV2 AU BURKINA EASO.

Sangaré, Lassana *; Kanki, P.***; Soudré, R.**; Tiendrebéogo, H. **; M'Boup, S. *; Essex, M. ***, et al.
* Hopital A. Le Dantec, Dakar, Sénégal; ** Hopital Yalgado Ouédrago, Ouagadougou, Burkina Faso; *** Harvard School of Public Health, Boston, Massachusetts, Etats-Unis.

Objectif. Déterminer l'évolution de la séroprévalence dans une population de prostituées doublement exposées à HIV1 et à HIV2.
Méthodes. En 1986, une première étude séroépidémiologique a permis de rechercher par Western Blot et RIPA, la présence d'Ac anti-HIV1 et anti-HIV2 dans 303 sérums de prostituées.
En 1987, une étude similaire a porté sur 261 sérums de prostituées. Parmi celles-ci, certaines de la première enquête ont été retrouvées.
Résultats. Les séroprévalences rapportées ont été respectivement de:

Année	Total testé	HIV1	HIV2	HIV1 /HIV2
1986	308	8.8%	14.6%	5.8%
1987	268	14.9%	5.6%	4.8%

Parmi les prostituées retestées lors de la seconde enquête (N=14), nous avons observé 35,7% de séroconversion avec 21,4% pour le HIV1 et 14,3% pour le HIV2. Par ailleurs, dans ce même groupe nous avons noté l'apparition de double profil chez 7,0% des prostituées antérieurement infectées par le HIV2.
Conclusion. Ces différents résultats montrent une importante circulation du HIV1 qui tend à se substituer au HIV2. La poursuite de ce travail permettra de préciser les conditions de survenue des cas de double infection à HIV1 et HIV2.

Th.G.0.28 FACTORS ASSOCIATED WITH PREVALENT HIV-1 INFECTION IN PREGNANT WOMEN IN MALAWI.

Chiphangwi J. Ndovi E. Dallabetta G. Miotti P. Liomba NG. Alfred J. Saah.
The Queen Elizabeth Central Hospital. Blantyre. Malawi. and The Johns Hopkins School of Hygiene and Public Health. Baltimore. MD. USA.

Objective. To determine factors associated with prevalent HIV-1 infection in pregnant women in Malawi.
Methods. 247 consecutive women who presented to the antenatal clinic at the QECH during December 1988 were tested for HIV-1 antibody and had their charts reviewed. Antibody testing was done by ELISA with Western blot confirmation. Informed consent was obtained from each participant. Variables that were examined included age. trimester at presentation. gravidity. occupation. VDRL. history of: TB. STD. transfusions. spontaneous abortion. still birth. prematurity. and neonatal death.
Results. 46 of the 247 (19%) women were seropositive for HIV-1. Reactive VDRL was significantly associated with HIV-1 seropositive status (15% vs 5%. p=0.02). 37 of the 204 women who had had prior pregnancies were HIV-1 seropositive. History of spontaneous abortion in this group was of borderline significance (27% vs 14%. p=0.06). None of the other variables was significantly associated with HIV-1 infection.
Conclusion. This cross-sectional analysis shows that reactive VDRL should raise one's index of suspicion regarding HIV-1 seroreactivity. Also. HIV-1 infection may play a role in fetal wastage.

Th.G.0.30 COMPARISON BETEWEN RISKY PRACTICES IN FEMALE PROSTITUTES AND GAY AND BISEXUAL MEN.

Izazola JA*, Romero C*, Valdespino JL*, Sepulveda, J.*
Directorate of Epidemiology, Ministry of Health. Mexico.

Objective. To determine the prevalence of risky sexual practices in female prostitutes and gay and bisexual men in Mexico.
Method. A survey was done in Guadalajara, Tijuana, Monterrey, Acapulco, Merida, and Mexico City in May, 1988, in female prostitutes and gay and bisexual men, investigating the frequency of risky sexual practices.
Results:

	Prostitutes				Gay and bisexual men		
Sexual techniques	Always	Half of the time	Never	Sexual techniques	Always	Half of the time	Never
1	91%	1%	8%	a	28%	18%	53%
2	0.6%	0.5%	97%	b	30%	17%	49%
3	7%	5%	88%	c	25%	15%	58%

1:Vaginal coitus, 2: Anal Receptive, 3: Fellatio   a: Anal Insertive, b: Anal Receptive c: Fellatio

Frequency of semen deposit in prostitutes was: vaginal: 60% always, 15% half of the time, 23% never; anal: 30% always, 1% half of the time, 46% never; and oral: 35%. In gay and bisexual men, frequency of semen deposit was: insertives: 49% always, 12% half of the times, 35% never; receptives: 42% always, 18% half of the time and 37% never: oral receptives: 9% always, 95% half of the time, and 78% never.
Conclusion. Although HIV prevalence in gay and bisexual men ranges from 2% to 30% and is less than 1% in prostitutes, the high level of risk in sexual practices alerts on the need of strengthening educative efforts directed to these groups.

Aspects cliniques
Clinical

Th.G.O.31

ROLE DU CENTRE DE LUTTE CONTRE LES MST DANS LA PREVENTION DE L'INFECTION A VIH. "L'EXPERIENCE DU SENEGAL".

Mdove.Ibra*; Mboup.S**; Sy.MTA***; VanderVeen.F*; Siby.E**; Thior.I**.
*Bureau National MST.Dakar.Sénégal.**Université Seikh Anta Diop. Dakar. Sénégal.***Ministère de la Santé Publique.DHPS. Dakar. Sénégal.

Objectif. Montrer les avantages du centre MST dans la collecte des données de l'infection à VIH, le suivi et la prise en charge des populations à risque sur le plan clinique, biologique, curatif et social.
Méthode. Une équipe pluri-disciplinaire de cliniciens, biologistes et assistants sociaux est responsable pour la prise en charge des patients symptomatiques et le dépistage périodique de prostituées.
Resultats.2 à 3% des consultants en MST sont séropositifs en VIH.

- 12% des 1165 prostituées suivies régulièrement sont séropositifs (10,8% VIH-2; 0,9% VIH-1; 0,2% VIH1/VIH2).
- 15% des contacts sexuels des consultants MST, infectés par VIH sont retrouvés et pris en charge.
- Le taux de séroconversion est lent en comparaison avec des études de groupes comparables dans des autres pays africains.
- La consommation de préservatifs dans le centre MST a doublée depuis la détection des premiers cas de SIDA au Sénégal.

Conclusion. Les centres MST jouent un rôle important dans le dépistage et la prise en charge de personnes infectées et dans le suivi de contacts sexuels. L'intégration de la lutte contre le SIDA dans les activités de ces centres est une stratégie efficace et efficiente pour influencer le comportement sexuel de groupes à risque et est indispensable pour une collecte de données plus fiable et un suivi plus aisée des populations les plus affectées.

Th.G.O.32

PATHOLOGY OF HIV INFECTION IN ZAIRE

Kayembe, M*; Nelson, Ann Marie*/**/***; Ilunga, N*; Angritt, P***; Kalengayi MM* et al; *University Hospital of Kinshasa;**Projet SIDA, Kinshasa; ***Armed Forces Institute of Pathology, Wash DC,U.S.A.

Objective: To define the pathology of HIV infection in Zaire.
Methods: Biopsy and autopsy material from urban and rural areas of Zaire were studied by routine gross and microscopic examination including special stains for microorganisms. Criteria for inclusion was a positive HIV serology or clinical evidence of HIV infection.
Results: Preliminary results are available from 87 biopsies and 8 autopsies. Males and females were equally represented in the series; the ages ranged from 8 mos to 60 yrs. The most common biopsy sites were lymph node(LN) (27) and skin(17). Kaposi's sarcoma (KS) was identified in 17 cases from a variety of sites: skin, lymph node, conjunctiva and gastrointestinal mucosa (M:F=3:1). 65% of the LN biopsies revealed a typical HIV associated lymphadenopathy, predominantly the hyperplastic type. All the autopsies and 25% of the biopsies revealed an infectious pathology; the most common being tuberculosis (n=8). No cases of Pneumocystis carinii were identified in our series. Only two of six cases of clinically suspected tuberculosis were proven by autopsy, the rest were other opportunistic infections such as nocardiosis and histoplasmosis. No significant differences were seen between urban and rural cases.
Conclusions: (1) Infections, especially tuberculosis, and KS, both cutaneous and visceral, are frequent histopathologic findings in Zaire (2) An increased rate of autopsies is essential to better define the pathology of HIV infection in our country.

Th.G.O.33

CLINICAL FINDINGS IN 201 SYMPTOMATIC CHILDREN WITH AIDS

*Davachi, Farzin, *Kabongo, L., *Mayemba, N., *Ndoko, K., *Ngoie, K., and **N'Galy, B.
*Department of Pediatrics, Mama Yemo Hospital and **Ministry of Health, Kinshasa, Zaire

Objective: To define the clinical findings in symptomatic children with AIDS.
Methods: Recognizing that there is a paucity of information on symptomatic infants and children with AIDS, we investigated 201 symptomatic cases admitted to the Department of Pediatrics at Mama Yemo Hospital. Diagnosis of each patient was confirmed by HIV ELISA and Western Blot tests.
Results: 86 infants, 1-24 months, and 115 children, 2-12 years, were studied. All were symptomatic at the time of admission. 195 (97%) presented with severe weight loss (160 (85%) weighing less than 3rd percentile weight for age), 171 (85%) with fever of one month duration, 136 (68%) with asthenia, 127 (62%) with diarrhea of more than 4 weeks duration, 127 (63%) with opportunistic infections, 122 (61%) with respiratory infections, 105 (52%) with hepatomegaly, 82 (41%) with anorexia, 56 (28%) with splenomegaly, 50 (25%) with vomiting, 49 (24%) with generalized lymphadenopathy, 37 (18%) with neurological complications and 37 (18%) with abdominal pain.
Conclusion: The most dramatic finding in both age groups was profound weight loss. Chronic fever, opportunistic infections, respiratory infections and lymphadenopathy were more common in older children whereas asthenia, chronic diarrhea and anorexia were more prevalent in infants. Our data suggests that the clinical presentation of AIDS varies in the infant age group from older children.

Th.G.O.34

VALIDATION OF A CASE DEFINITION FOR PERINATALLY ACQUIRED AIDS IN AFRICA

Nsa, Wato*; Manzila, T.*; Kabagabo, U.*; Mvula, M.*; Ryder, R.*/**. *Projet SIDA, Kinshasa, Zaire; **CDC, Atlanta, GA. U.S.A.

Objective. To validate a provisional WHO clinical case-definition for pediatric AIDS acquired via perinatally-acquired HIV infection (PI).
Methods. Three groups of children born to HIV(+) mothers have been followed monthly since birth. Group I consisted of 71 infected children with lab evidence of PI (cord blood culture and/or HIV IgG at age 12/18 months). Group II had 281 children with HIV(+) mothers but without PI. Group III consisted of 560 control children born to HIV(-) mothers. To validate the case-definition we compared the prevalence of selected criteria in Group I with Group II children and calculated sensitivity (SENS), specificity(SPEC) and positive-predictive value(PPV) of the definition. Criteria for HIV infection were quantified with 3 points given for a major(Maj) sign and 2 for a minor(Min) sign. A score of)10 was defined as clinical AIDS.
Results

Criteria	Sign	Criteria Prevalence(%) GpI	GpII	GpIII	SENS	SPEC	PPV
Fever)15 days	Maj	35%	15%	9%	35	86	39
Diarrhea)15 days	Maj	48	16	15	38	84	39
Failure-to-thrive	Maj	76	48	39	69	51	26
Generalized lymphaden.	Min	77	41	22	72	61	32
Thrush after age 6 mos.	Min	30	11	8	28	90	42
Pneumonia	Min	48	35	36	44	65	25
Papular dermatitis	Min	48	32	24	40	68	23
Fulfilled AIDS case definition		37	7	5	37	93	59

Conclusions. The provisional pediatric case-definition for AIDS has a high specificity but its lack of sensitivity will limit its usefulness in surveillance.

Th.G.O.35

CLINICAL FINDINGS AMONG HIV-INFECTED INDIVIDUALS ATTENDING THE DERMATO-VENEREOLOGY CLINICS

Mugerwa Roy; Mmbuga P; Sewankambo N; Katabira E;
Makerere University, Kampala, Uganda.

Objective: To obtain clinical data on HIV seropositive patients attending the clinics.

Methodology: During a two-months period, all patients attending the clinics were interviewed about presenting symptoms, socio-medical history and sexual history. They were examined and blood was drawn for HIV serology and VDRL.

Results: Among 97 patients, posterior cervical adenopathy and herpes zoster were significantly co-related with seropositivity. Seborrhoeic dermatitis, prurigo, pyoderma, urticaria and other drug eruptions, Kaposi Sarcoma skin lesions, aggressive scabies, psoriasis, tinea versicolor and other fungus skin infections, as well as hair and nail changes were more common among HIV positive cases. 16 out of 47 patients with STD were seropositive. Chancroid occured among 79% of seropositive patients compared to 42% among seronegative ones. No difference was noted with respect to urethritis.

Conclusion: STD/Skin clinics have a big reservoir of HIV-infected people. Unexplained posterior cervical adenopathy and herpes zoster should be included among major criteria. Various skin lesions are highly predictive of HIV infection. Genital ulcer disease is both a manifestation of and a risk factor for HIV infection.

Th.G.O.36

EVALUATION OF CLINICAL ILLNESS AND TIMING OF SEROCONVERSION IN SEXUALLY TRANSMITTED ACUTE HIV-1 INFECTION.

Cameron DW: D'Costa LJ; Maitha GM; Ronald AR; Ndinya-Achola JO & Plummer FA.
Univ. Nairobi, Nairobi City Commission, Nairobi, Univ. Manitoba, Winnipeg. CANADA

Objective. To time seroconversion from sexual exposure and characterize clinical illness in acute HIV-1 infection.
Methods. In a longitudinal HIV-1 seroincidence study, 19 seroconverting men were clinically evaluated within 8 weeks of seroconversion, and matched with 72 men remaining seronegative 16 weeks from high-risk contact. Six seroconversions in 73 men followed 13 + 15 (2 - 71) weeks were timed from recent, isolated high risk sexual contact.
Results. Four of 19 (21%) seroconverters had no signs or symptoms. Fever in 10 (53%), itching in 9 (47%), headache in 7 (37%) and generalised lymphadenopathy in 12 (63%) seroconverters was detected. All illness was mild. Generalised lymphadenopathy was significantly more frequent in seroconverters (63%) than in controls (30%, $p = 0.02$). Six seroconversions occurred at a mean + SD (range) of 5.9 + 2.6 (2.9 to 10.1) weeks from a single high risk sexual contact.
Conclusions. Illness associated with acute HIV-1 infection and seroconversion is clinically subtle. Seroconversions were seen between 2 and 12 weeks of sexual exposure.

EPIDEMIOLOGY OF AIDS IN THE BAHAMAS AUG 1985 - MAR 1989

Ofosu-Barko Kenneth, Aymer F, Bain R, Miller M.L., Gomez P,
Ministry of Health, Nassau Bahamas.

OBJECTIVE To describe the AIDS epidemic in The Bahamas during the period August 1985 - March 1989.

METHODS Information from notifications of AIDS patients and contact tracing HIV testing and blood donor screening were analyzed.

RESULTS Three hundred and eight cases of AIDS were reported over a period of 44 months. The incidence rate per 100,000 rose from 16 in 1985 to 38 in 1988. Ten of the 24 inhabited islands have been affected. Fifty-five (17.8%) cases occured in children. The proportion of cases due to perinatal transmission has varied from 27.7% in 1985 to 7.7% in 1989. Heterosexual transmission accounts for 59% of cases, homosexual 2%, bisexual 6%. Among the adults 34% were free base cocaine abusers, (not IV users). The fatality rate is 50.6%. The number of HIV infected individuals identified has increased from 20 in 1985 to 419 in 1988 with a cumulative total of 910. Of the 10,369 units of blood screened during this period, 48 (0.46%) were found to be positive for HIV infection.

CONCLUSION There has been a rapid increase of AIDS and HIV infection in The Bahamas. The proportion due to perinatal transmission though high, has shown a significant decrease. The predominant mode of transmission is heterosexual. Cocaine abuse has contributed to the spread of HIV infection.

SITUATION EPIDEMIOLOGIQUE DU SIDA EN GUYANE FRANCAISE -

Dr VIENNE - D.D.A.S.S. de-Cayenne - Médecin Inspecteur de la Santé.
avec la collaboration des membres du Comité SIDA Guyane.

131 cas de SIDA ont été recensés entre 1982 et 1988 dans une population estimée à environ 100.000 habitants.

Dans ce département français la transmission hétérosexuelle du VIH est prédominante.

14 cas pédiatriques cumulés montrent la transmission materno foetale correspond à plus de 10% des patients atteints du SIDA.

Les infections opportunistes sont majoritaires dans les manifestations cliniques alors que le sarcome de kaposi n'a été retrouvé que chez deux patients.

96 de ces malades sont à ce jour décédés.

Th.G.0.46

STRATEGIES FOR PREVENTION AND CONTROL OF AIDS IN HAITI

Timothée, Gabriel. CARE PWR Haiti, Port-au-Prince Haiti.

Th.G.0.47

AIDS EDUCATIONAL STRATEGIES AND ETHNIC DIVERSITY IN SURINAME

del Prado, Ruben F.
"National AIDS Program" of the Bureau of Public Health,
Paramaribo, Suriname, So. Am.

In the 18th century, Suriname (then also known as Dutch Guiana) had a prosperous plantation economy, based on the labour of African slaves. To counteract the manpower shortage after the abolition of slavery in 1863, the immigration of indentured labourers from British India began in 1873, followed by a similar movement of Javanese from the Dutch East Indies. The multi-ethnical,multi-cultural,multi-religious,multi-lingual society which now comprises the Republic of Suriname, has major ramifications for any [health] education program. The official language is Dutch, but Sarnami Hindustani;Javanese;Chinese;several Amerindian and Bushnegro (Maroon) languages, and a vernacular comparable to Creole: Surinamese, are widely spoken. More so than in other Caribbean countries the official language is only "official" in the true sense of the word. Although AIDS education faces the usual dilemmas as anywhere in the world, we meet this extra challenge of real ethnic diversity in a nation without a common voice. The first classified case of HIV infection dates back to 1982, and Suriname has since seen 36 people with clinical HIV infection(AIDS+ARC) out of a total of 61 known to be HIV infected. Though we do not have an approximation of the total number of HIV infected in Suriname, we believe that the number of clinical cases is as close to reality as possible. With an estimated 400,000 inhabitants, Suriname lags behind its neighbouring countries in regard to the number of people with AIDS. It is a dismal thought, but we may only be lagging behind the wave of a substantial outbreak of HIV related diseases.
A delay which we may (hypothetically) attribute, in part, to our special socio-demographic make-up with explicit norms concerning human sexuality.
But these very same cultural mores, in their diversity, could very well impede our AIDS education efforts.

Th.G.0.48

CHALLENGES IN DEALING WITH THE AIDS EPIDEMIC IN TRINIDAD AND TOBAGO

Beulah Duke
Ministry of Health, National AIDS Programme, Republic of Trinidad and Tobago

Objective. To discuss the socio-cultural factors influencing programme activities as we respond to the AIDS epidemic in Trinidad and Tobago.
Method. The presentation will be based on the personal experiences of the Programme co-ordinator in dealing with AIDS [illegible]
Result. Sexual transmission of HIV has been identified as the main mode of spread, as seen in cumulative total of 309 cases of AIDS over period 1983 - December 1988 (heterosexual 37.1%, homosexual 34.0% and bisexual 18.5%). Blood screening for HIV was initiated in 1985. A Cabinet appointed National AIDS Committee was established in 1987. Efforts to control AIDS are channelled through public education, training of Health Care Workers, counselling and social support services and community participation. Some of the major challenges appear to be the need for focused, sustained interest and willingness to address the problem of HIV infection/AIDS in the real centres of social and economic power and authority, at community and institutional levels. No new mind set has yet emerged in response to provision of services or treatment at institutional level for Persons With AIDS. Factors such as existing limited informational and management systems in the health sector, as well as inadequate laboratory and support services for HIV testing for the worried well impact on efforts to control the problem. There is need to increase the cadre of personnel who can educate for behaviour change or provide counsel and support for clients and families.
Conclusion. Although the AIDS Control Programme has been implemented in Trinidad and Tobago since 1987, there are some serious constraints which must be addressed, both at individual, community and institutional levels.

Le SIDA chez l'enfant
Pediatric AIDS

Th.G.0.49 MORTALITY ASSOCIATED WITH HIV AND DIARRHEA IN HAITIAN CHILDREN

Pape, Jean William, Oriol,L., Madhavan,S., Johnson,W.D.Jr.
Cornell University Medical College, NY,NY. U.S.A.

Objective To determine the mortality rate and associated co-factors in children discharged from a rehydration unit in Port-au-Prince, Haiti.
Methods From February 1986 to July 1987, 217 randomly selected children were followed for a minimum of 3 months after discharge from the State University Hospital rehydration unit. Age-matched healthy neighborhood controls (n=128) were similarly followed. All patients and controls had HIV serology (ELISA), weekly home visits and at least monthly physician evaluations.
Results Nineteen per cent (41/217) of the patients and 3% (4/128) of the controls died during the follow-up period. One-half of the patient deaths occured within 2 weeks of discharge and 61% occured at home. Pneumonia and sepsis were the most common causes of death. Characteristics of the patient and control groups are noted below:

	Patients		Controls
	Alive	Dead	
	n=176	n=41	n=128
Age (months)	6.3	4.5	7.6
Severe malnutrition (%)	16	39	15
Bottle-fed only (%)	40	66	21
Oral thrush (%)	5	34	0
HIV seropositive (%)	3	32	3

Conclusion Despite low in-hospital mortality (< 1%) and adequate rehydration, 19% of patients died within 3 months of discharge. Factors associated with patient deaths include age, severe malnutrition and HIV seropositivity.

Th.G.0.50 PEDIATRIC AIDS IN BRAZIL – DESCRIPTION AND ANALYSIS OF TRENDS

Bergamaschi, Denise*; Chequer P.*; Rodrigues, L.*; Castilho, E.**
*Ministry of Health - National Division of STD/AIDS- Brasília, Brazil,** Oswaldo Cruz Foundation/Ministry of Health-Rio de Janeiro, Brazil.

Objective. To describe the pediatric AIDS in Brazil, to quantify the problem, to identify high-risk groups, to work out explanatory hypotheses, and to propose measures for prevention and control.
Methods. All cases of pediatric AIDS reported to the Epidemiological Unit of the Ministry of Health's National STD/AIDS Division in the period from 1980 to 1988 were analysed. The analysis of the data was carried out by means of crossed and simple tables and diagrams, and by statistical tests. Information was gathered concerning the risk factor of the parents, through review of medical records, case discussion, and additional epidemiological investigation when it was necessary.
Results. In the period from 1980 to 12/03/1988, 175 cases of pediatric AIDS were reported to the Ministry of Health, with a case-fatality rate of 56%. The observed male/female ratio was 2:1. If haemophiliac cases were excluded, this ratio was 1:1. Of the reported pediatric cases, 35% caught the infection before, during or soon after the birth (perinatal transmission), 30% were haemophiliacs, 28% received a blood transfusion and/or components. There are 3 cases of drug-users (2%) and 5% were either not investigated or were unclear with regard to the category of transmission. The first pediatric AIDS cases were diagnosed in 1984 in haemophiliacs; however, the proportion of this group has been decreasing with a consequent increase in the occurrence of perinatal cases or those related to blood and/or components transfusions. By means of temporal distribution it was possible to observe a perfect positive correlation ($r=1$) between cases of perinatal transmission and cases of IV drug users. The cases of perinatal transmission, when analysed according to the parents' risk factor, show that around 60% had parents who uses IV drugs, and approximately 20% had bisexual fathers (preliminary data).
Conclusions. Pediatric AIDS in Brazil may be seen as an emerging problem with a possible tendency towards changing the categories of transmission. Given the positive association between perinatal AIDS cases and cases of drug-users, the observed increase in the number of drug-users may bring a sharp rise in perinatal transmission. It is therefore clear that measures for prevention and control must be directed as a priority towards the group of IV drug users.

Th.G.0.51 THE EFFECT OF HIV-1 AND HTLV-1 INFECTIONS ON BIRTHWEIGHT IN A POPULATION WITHOUT IV DRUG ABUSE

Holt, Elizabeth*; Boulos, R**; Halsey, NA*; Brutus, JR**; Auguste, U**; Davis H**; et al.***
*The Johns Hopkins University, Baltimore, MD, USA **Centers for Health and Development, Port-au-Prince, Haiti ***National Cancer Institute, Bethesda, MD, USA

Objectives. To determine the impact of maternal HIV-1 and HTLV-1 infections on birthweight (BW).
Methods. Woman residing in a periurban Haitian slum were screened at 6-to-8 months gestation for HIV-1 and HTLV-1 antibodies.
Results.

	HIV-1			HTLV-1		
	Pos.	Neg.	p-value	Pos.	Neg.	p-value
n = Hospital Deliveries	140	1464		46	1190	
Mean BW (gms)	3021	3082	0.200	3053	3073	0.837
< 2500 gms	15.0%	11.0%	0.154	13.0%	11.5%	0.750
Mean Mat. Wt.(kgs)	58.1	58.6	0.335	58.3	58.3	0.980

Maternal factors associated with LBW in logistic regression analysis were: inadequate prenatal tetanus toxoid (OR=2.2, 95% CI 1.2, 4.2); being unmarried (OR = 2.0, 95% CI 1.1, 3.6); sexual intercourse < 2 weeks preceding delivery (OR = 1.9, 95% CI 1.2, 3.1); and maternal weight < overall mean weight of 58.5 kgs. Smoking, alcohol use, socioeconomic and educational status were not associated with LBW. However, only 5.3% of the mothers smoked, 1 % drank alcohol, and all were of very low SES. IV drug abuse is not known to occur in this population.
Conclusions. Maternal HIV-1 and HTLV-1 infections had minimal impact on birthweight in these relatively asymptomatic women.

Th.G.0.52 MORBIDITY AND MORTALITY IN INFANTS OF HIV-1 INFECTED MOTHERS.

Datta, Pratibha*;Embree, J.E**; Braddick, M***, Kreiss, J+,*; Ndinya-Achola, J*;Plummer, F.A*,**.
*University of Nairobi, Kenya,** University of Manitoba, Winnipeg, Canada, ***Middlesex Hospital, U.K; + University of Washington, Seattle, U.S.A.

Objective: To assess the impact of HIV-1 on infant morbidity and mortality.
Method: Women attending the Pumwani Maternity Hospital in Nairobi, Kenya were screened for HIV-1 Ab. Infants of 128 HIV+ women(cases) and 206 HIV- women (controls) were enrolled at birth and followed prospectively.
Results: One hundred and thirty five case infants and 223 control infants were followed for an average of 10 and 9 (range 1-33) months. 31(23%) case infants and 25(11%) controls developed pneumonia (P=.005), and 16(12%) case infants versus 9(4%) controls had otitis media (OM) (P=.01). Measles developed in 7 case and 4 control infants (P=NS) and chicken pox in 2 infants from each group. 30(22%) case infants and 25(11%) controls failed to thrive (FTT) during the study period (P=.02). Failure to thrive occured before the age of 9 months in 16(53%) of 30 case infants compared to only 4 (16%) of 25 controls (P=.005). Infant mortality (IM) was 10/135 (7.4%) in cases and 6/223(2.7%) in controls, (P=.04). Infants of HIV+ mothers with more advanced HIV disease or subsequent death (25) had higher IM,FTT and OM than infants with asymptomatic mothers (103):IM(24% VS 4%, P=.003),FTT (48% VS 17%, P=.002), OM (32% VS 8%, P=.003).
Conclusion: Significant infant morbidity and mortality is associated with prenatal HIV-1 exposure and is correlated with more advanced maternal HIV disease.

Th.G.0.53 HIV INFECTION AS A RISK FACTOR FOR POOR OBSTETRICAL OUTCOME

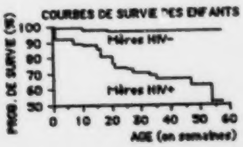
Temmerman, Marleen* ***, Mirza, N.*, Plummer, F.* **, Ndinya-Achola, J.O.*, Wamola, I.*, Piot P.*** et al.
* Univ. Nairobi, Kenya; ** Univ. Manitoba, Winnipeg, Canada; *** Inst. Tropical Medicine, Antwerp, Belgium

Objective: To determine whether HIV infection and other sexually transmitted diseases (STD) are riskfactors for low birth weight and stillbirth (SB).
Methods: Using a case-control design, 1300 women were recruited within 24 h. after delivery in one maternity hospital in Nairobi, Kenya. Infants with a birthweight ≤ 2500 g. were divided into preterms (P) (n = 321) and small for gestational age (SGA) (n = 181) using the Dubowitz'score. SB's were divided into intra-uterine foetal deaths (IUFD) (n = 89), and intra-partum foetal deaths (IPD) (n = 55). Controls were randomly selected from mothers delivering a neonate > 2500 g. Data collection included sociodemographic features, sexual and medical history, clinical signs and symptoms, serology for HIV and syphilis, and microbiology for *N. gonorrhoeae*, *C. trachomatis*, *S. agalactiae*, *M. hominis*, *U. urealyticum*, *T. vaginalis* and bacterial vaginosis.
Results: 3.2 % of the controls had HIV antibody. Preterm birth was associated with HIV infection (8.4 % pos., p = 0.008, OR = 2.8), as well as primiparity, being single, sex during pregnancy, rupture of membranes (ROM) as initial obstetrical event (IOE), and lack of antenatal care. SGA was associated with HIV infection (8.5 % pos., p = .006, OR = 2.7), primiparity, < 20 y., and hypertension. IUFD was associated with syphilis (18 % pos., p < .0001, OR = 6.4), HIV infection (11.2 % pos., p = .001, OR = 3.8), sex during pregnancy, previous SB, hypertension, and lack of antenatal care. IPD was associated with HIV infection (14.5 % pos., p = .0002, OR = 5.1), being single, previous SB, and postpartum endometritis. No association was found between other STDs and poor obstetrical outcome. At 2 weeks of age, 12 % of preterms had died, as compared to 1.5 % of the SGAs and controls.
Conclusion: Poor obstetrical outcome was strongly associated with HIV infection. However, further investigations are necessary to determine biological causality.

Th.G.0.54 SURVIE DES ENFANTS NES DE MERE POSITIVE POUR HIV1 : ETUDE PROSPECTIVE A BRAZZAVILLE (R.P. CONGO).

Marc Lallemant*, S.Lallemant Le Coeur**, D.Cheynier***, S.Nzingoula***, M.Sinet**, B. Larouzé** et al. * ORSTOM (S/URB), Brazzaville/Paris, ** INSERM U13, Paris , *** Minist. Santé/DSMIES, Brazzaville.

Objectif : Estimer la survie différentielle des enfants nés respectivement de mère positive et négative pour anti-HIV1.
Méthodes : 1833 femmes enceintes ont été prélevées de mai 1987 à mars 1988 dans 2 centres de surveillance prénatale et testées pour anti-HIV1 (ELISA Pasteur, confirmation WB Dupont de Nemours). Chacune des 71 femmes anti-HIV1+ (3.9%) a été appariée sur l'âge et la date présumée d'accouchement avec 2 mères négatives. 65 enfants nés de mère anti-HIV1+ et 130 enfants témoins ont été suivis (recul moyen au 20/12/88 : 13 mois ; 7 à 16 mois). Les probabilités de survie ont été estimées par la méthode de Kaplan .
Résultats : A la naissance, les 2 groupes d'enfants ne différaient pas pour la mortinatalité, le sex-ratio, le terme et le poids. La probabilité de survie était de 0,98 (ds=0,01) à 3 mois chez les témoins puis restait stable. Elle était, chez les enfants nés de mère anti-HIV1+, de 0,88 (ds=0,04) à 3 mois, de 0,73 (ds=0,06) à 6 mois, de 0,67 (ds=0,06) à 9 mois et de 0,52 (ds=0,11) à 1 an.



Conclusion : La surmortalité des enfants nés de mère anti-HIV1+ est hautement significative (p<.001). Les décès sont plus fréquents (taux de transmission plus élevé ?) et plus précoces (rôle de l'environnement infectieux tropical ?) que dans les cohortes occidentales.

Epidemiology

M.G.P.1

PATTERNS AND TRENDS OF HETEROSEXUAL TRANSMISSION OF HIV AMONG BRAZILIAN AIDS CASES

Castilho, Euclides*; Chequer, P.**; Bergamaschi, D.**; Rodrigues, L.**.
*Oswaldo Cruz Foundation/Ministry of Health-Brazil, Rio de Janeiro, Brazil, ** Ministry of Health- National Division of STD/AIDS, Brasilia, Brazil.

Objective. To characterize the heterosexual transmission category of HIV, among AIDS cases comparing the features throughout the period from 1982 to 1988.
Methods. All AIDS cases reported in the heterosexual transmission category (404) were analysed over time. They represent a proportion of 8% of the total cases reported to the National Epidemiological System of AIDS. This category was compared to the others by gender, age, education level, and incidence of Kaposi's Sarcoma, using Chi-Squared and Fisher's exact tests.
Results. In 1984 the heterosexual transmission category cases corresponded to 5% of all sexually transmitted cases, while in 1988 this proportion reached 17%. Among heterosexual transmitted cases, the male/female ratio of 4:1 in 1984 decreased to 2:1 in 1988. This feature persisted over time and it has been homogeneous throughout the country.
Considering the male cases, it was observed that 10% were in the 20 – 47 age group. This proportion does not differ significantly for homo/bisexual male cases (91%) or for the indeterminate category AIDS cases (85%).
As far as educational status is concerned, there is not a significant difference of high-level of schooling when taking into account heterosexual male cases (34%) and indeterminate male cases (39%).
The incidence of Kaposi's Sarcoma in homo/bisexual male cases (16%) is significantly greater than the rate for heterosexual male cases (10%) ($p < 0,05$). The rate for indeterminate male cases was 11%.
The age distribution for females who acquired AIDS through heterosexual contact was similar to the cases acquired by intravenous drug use.
Conclusions. The excess of risk for males among the heterosexually transmitted cases, observed in Brazil is not compatible with the Pattern of AIDS, as has been, observed in several Western countries. This paper points to the necessity of a thorough study for validation of the classification criteria for the heterosexual transmission category.

M.G.P.2

HIV 1 and HIV 2 SEROLOGICAL SURVEY in LUNDA NORTE, NORTHEASTERN PROVINCE of REPUBLICA POPULAR de ANGOLA.

M. J. Matos Almeida*, M.O. Santos Ferreira**, M.H. Lourenço**, T. Cohen***, J.M. Azevedo Pereira** *S. Dermatologia, H. St. Maria, Lisboa, **Lab. Virologia, Fac. Farmácia, Univ. Lisboa, Portugal ***Dep. Saúde Pública., Univ. Agostinho Neto, Luanda, R.P. Angola. JNICT GRANT 87-679

Objective: From May to September 1987, a HIV1 and HIV 2 serosurvey has been carried out in three out of the four main urban centers of Lunda N. where STD incidence is high.
Methods: We used the imunoenzimatic method ELISA, positive sera being confirmed by W. Blot.
Results:

	Town	Group	N°	HIV 1 (%)	HIV 2 (%)	HIV 1+2 (%)	Total (%)
Healthy People	DUNDO	Pregnants	44	6.8	6.8	4.5	18.2
		Bl donors	50	8.0	16.0	0.0	24.0
		Military	54	1.8	13.0	0.0	14.8
		Volunteers	37	8.1	2.7	0.0	10.8
Patients		STD	219	11.0	10.5	3.5	25.0
		Tuberculos	65	7.7	6.2	3.0	17.0
		In-patients	108	7.4	14.8	2.8	25.0
	ANDRADA	In-patients	26	30.7	0.0	15.3	46.0
	LUCAPA	Out-patients	200	7.5	4.5	1.5	13.5

Conclusion: Another HIV 2 focus and highly prevalent HIV infection are present in areas closer the Rep. of Zaire. Concomitant seropositivity for both viruses is relevant specially in Andrada. Clinical data of seropositif patients is available in some groups namely STD patients.

M.G.P.3

THE SEROPREVALENCE OF HTLV-1 AND HIV-1 CO-INFECTION IN HAITI

Giordano, Michael*, Pape,J.*, Blattner, W.**, and Johnson, WD.*
*Division of International Medicine, Cornell University Medical College, New York, NY. **National Cancer Institute, Bethesda, Md. U.S.A.

Objective: To determine the seroprevalence of HTLV-1 and HIV-1 infection in selected population groups in urban Port-au-Prince, Haiti, including healthy and ill persons.
Methods: Serum from 3,078 persons was tested for HTLV-1 antibody by ELISA (whole virus, Biotech) with RIA confirmation (p24 antigen, Biotech) and for HIV-1 antibody by ELISA (DuPont).
Results: The seroprevalence of HTLV-1 infection in the study cohort was 8.3% (256/3078). Co-infection with both HTLV-1 and HIV-1 was documented in 5.9% of subjects (183/3078). HTLV-1 infection rates were highest in AIDS patients, their spouses and in prostitutes. This group accounted for 94% (173/183) of co-infected subjects. The study populations are noted below:

Populations	Total number	HTLV-1		HIV-1		Both	
		n	(%)	n	(%)	n	(%)
Factory workers	84	4	4.8	3	3.5	0	
Hotel workers	25	1	4.0	2	8.0	0	
Leprosy patients	96	7	7.3	6	6.3	1	1.0
Clinical lab specimens	1097	56	5.1	70	6.4	9	0.8
Children w/diarrhea	139	1	0.7	1	0.7	0	
AIDS patients	951	132	13.9	938	98.6	131	13.8
Spouses of AIDS patients	557	47	8.4	187	33.6	31	5.6
Prostitutes	129	16	12.4	56	41.9	11	8.5
	3078	256		1261		183	

Conclusion: HTLV-1 and HIV-1 are endemic in Haiti. Infection with both viruses was most commonly observed in AIDS patients, their spouses and in female prostitutes.

M.G.P.4

ESTIMATE OF HIV INFECTION PREVALENCE IN BRAZIL

Castilho,E*;Struchiner,Claudio* et Guimarães,M.
*Oswaldo Cruz Foundation,Rio de Janeiro,Brazil;
**University of Minas Gerais,Belo Horizonte,Brazil.

Objective.To estimate the current number of persons infected with HIV from AIDS surveillance data.
Methods.Reported AIDS cases through December 1988 were used to estimate the number of infected people following the same approach adopted by CDC(MMWR 36 (N° S-6),1987). Data were adjusted for reporting delays. In the model, the number of AIDS cases diagnosed each year,t, can be seen as a convolution of the number of persons infected in each preceding year, and the number of those expected to be diagnosed with AIDS. The disease progression rates were assumed to be the same as those observed in the San-Francisco cohort, and the number of newly infected persons,i(t), in a specific year,t, was assumed to be described by exponential/logistic functions. The parameters of i(t) were estimated using nonlinear least squares estimators based on the pseudo Gauss-Newton interation.
Results.As of December 1988, the estimated number of HIV infected persons was 63000, and 50000 assuming logistic, and exponential as infection function, respectively
Conclusions.The projected estimates should be considered only as broad estimates of what may be occurring. On the other hand, for comparison purposes among other countries, and for health care planning those estimates could be useful.

M.G.P.5

HIV AND HEPATITIS B TRANSMISSION IN SUDAN

McCarthy, Michael*; Hyams,K.C.*; El-Dabi,M.**and Woody, J.*
* U.S. Naval Medical Research Unit No.3, Cairo, Egypt (A WHO collaborating center for AIDS);**Omdurman Military Hospital, Omdurman, Sudan.

Objective. To describe the prevalence and risk factors for HIV-1 and hepatitis B transmission among male soldiers living in different regions of Sudan.
Methods. A seroepidemiologic survey was conducted among 798 soldiers presenting to outpatient clinics between March 1987 and April 1988.
Results. Twenty-eight percent of the study population was born and raised in southern Sudan, an area bordering central Africa; and, 72% of study subjects were from northern Sudan. Seventy-seven percent of the study population had serologic evidence of past hepatitis B infection, and 13 individuals had confirmed antibodies to HIV-1. All HIV-positive soldiers had been living in southern Sudan during the previous five years; two of the 13 were northerners stationed in the South of Sudan and two were southerners who had been recently transferred to the North. Multivariate analysis indicated an association between living in the South of Sudan and both hepatitis B (odds ratio=8.2) and HIV-1 infection (odds ratio=14). A history of sexual relations with prostitutes was also found to be predictive of hepatitis B infection (odds ratio=1.5).
Conclusion. The increased risk of HIV-1 in southern Sudan is consistent with the proximity of this region to central Africa, where HIV-1 is endemic. The findings of this study suggest that sexual promiscuity is a risk factor for hepatitis B infection in Sudan. The findings also indicate one possible route for the spread of HIV-1 from central to northern Africa.
Supported by NAVMEDRSCHDEVCOM, Bethesda, MD Work Unit No. 3M463105H29.AA.335.

M.G.P.6

EMPIRICAL EXTRAPOLATION PROJECTIONS OF AIDS INCIDENCE IN BRAZIL.

Castilho, Euclides*; Struchiner,C*. and Guimarães,M**.
*Oswaldo Cruz Foundation,Rio de Janeiro,Brazil,**University of Minas Gerais, Belo Horizonte,Brazil

Objective.To project the short-term course of the AIDS epidemic in Brazil for health planning purposes and comparisons among others countries.
Methods.After adjustment for reporting delays, public data from the Brazilian AIDS Surveillance System were fitted to polynomial(quadratic)/exponential/logistic models by regression procedures.
Results.The following table shows the projections of the number of new cases for the next 3 years:

MODEL	YEAR 1989	1990	1991	CUMULATIVE NUMBER 1982-1991
Quadratic	6000	8000	10000	31000
Logistic	7000	10000	12000	36000
Exponential	8000	18000	38000	71000

Conclusion.Any application of these empirical projections must take in account the unrealistic patterns of the models since they do not incorporate any information on the transmition dynamic or natural history of HIV infection. Compartmental models must the considered in spite of their present limitations.

M.G.P.7 PREVALENCE DES INFECTIONS PAR LES VIRUS HIV1,HIV2 ET HTLV1 DANS LA REGION DE TANANARIVE MADAGASCAR

CHEVALLIER PHILIPPE,RITTER J,ANDRIAMANPIHANTONA E.,SEPETJAN M.
LABORATOIRE de SANTE PUBLIQUE, LYON, FRANCE.
MINISTERE DE LA SANTE TANANARIVE,MADAGASCAR.

Objectifs: Estimer la prévalence des infections par les virus HIV1, HIV2 et HTLV1 dans un échantillon de la population malgache de la région de Tananarive.
Méthodes:Nous avons étudié 448 individus (201 femmes,247 hommes) se répartissant en 32,3% d'enfants de moins de 16 ans,scolarisés,et 67,7% d' adultes ayant une activité professionnelle.Les prélèvements ont été effectués au cours du premier trimestre 1988.Les 448 sérums ont été testés pour les Anticorps anti-HIV1 (EIA Abbott) et anti-HIV2 (EIA Pasteur).Les tests de confirmation par W.Blot Biorad(HIV1)ou Pasteur(HIV2) ont été utilisés.Quatre vingt onze sérums dont 46% provenant de sujets appartenant à des ethnies minoritaires de l' île ont été testés pour les anticorps anti-HTLV1 (EIA Abbott).
Résultats: Nous n'avons trouvé aucun sérum positif pour les marqueurs sérologiques du virus HIV1.Trois parmi les 448 sérums ont montré une positivité en réaction immunoenzymatique, qui n'a pas été confirmée par les tests d' immunoblotting.Aucune positivité n' a été trouvée pour les anticorps anti-HIV2 et HTLV1.
La population étudiée se place cependant tout à fait dans le cadre des populations à risque pour ce type d' infections.En effet nous avons par ailleurs trouvé un taux de 18,5% d'antécédents de syphilis(TPHA positif) et de 71,4% d'antécédents d' infections par le virus de l'hépatite B (Anticorps anti-HBc positif).
Conclusion:Cette étude mérite d' être étendue à un plus grand nombre d'individus.Elle montre cependant que la population de Madagascar est beaucoup moins touchée que celle du reste du continent africain par ces rétrovirus.

M.G.P.8 HIV-1 INFECTION IN PREGNANT WOMEN FROM SANTOS, BRAZIL

Giraldes, P.*; Porto, A.*; Peixinho, Z.**; Longo, I.**; Souza, M.** and Mendes, Nelson**.
*Fac. Ciências Médicas Santos, Brazil,**Esc. Paul. Med.,São Paulo,Brazil.

Objective. To investigate the HIV-1 infection prevalence among volunteer pregnant women from Santos, Brazil.
Methods. HIV-1 antibodies were studied in serum samples from 514 pregnant women from the City of Santos (one of the major harbours of Brazil),obtained between February and October, 1988. The women were attending prenatal clinics from Public Health Service located at the inner-city area. The serum samples were initially tested by indirect ELISA using whole-virus preparation (VIRGO™ HIV-1 ELISA, Electro-Nucleonics). The positiveness to anti-HIV-1 was further confirmed by EIA employing recombinant viral proteins ("Dot blot" and/or indirect ELISA, Embrabio) and indirect ELISA using the synthetic peptide LGIWGCSGKLIC corresponding to a segment of gp41 (research test kit, Escola Paulista de Medicina).
Results. Twenty-four (4.67%) serum samples were repeatedly reactive in the screening test and 18 (3.50%) revealed to be anti-HIV-1 positive by confirmatory methods. The cumulative prevalence increased from 2.44% (6/245) in April 1988 to 3.50% (18/514) in October 1988. The major risk factors observed between the seropositive women were promiscuous sexual life, intravenous drug-addiction and sexual contacts with known HIV-1 infected individuals (some of them with AIDS).
Conclusion. These high rates of HIV-1 infection among pregnant women can not be extrapolated to other regions of the country, since Santos has the highest AIDS incidence coefficient in Brazil (44.4/100,000).

M.G.P.9 HIV-1 INFECTION IN SOME URBAN AND RURAL AREAS OF CAMEROON.

Aebischer,M.L.;Angeloni,U.;Costa,F.;Ippolito, Giuseppe*; Martorana, M.C.; Spedini, G.**; Angeloni P.
Italian Red Cross, *L.Spallanzani Hospital, **University La Sapienza-Roma,Italy

Objective. To estimate the prevalence of HIV-1 infection in urban and rural areas of Cameroon.
Methods. 1232 serum specimens from adults and 178 whole blood samples adsorbed on filter paper from children-collected during three anthropological research projects, from 1986 to 1988- were screened by ELISA and positive confirmed by WB. To estimate the perinatal transmission and intrafamiliar spread of HIV-1 infection have been tested 86 families.
Results: Prevalence rates are reported in table.

year	village/town	geog.area	number	HIV+ve	prevalence
1986	Ebone´	south-west	218	1	.0045
1986	Mbouda	west	151	1	.0066
1986	Bafoussam	west	253	4	.016
1987	Bakeat	south-west	204	0	0
1987	Bandjoun	west	300	1	.0033
1988	Mama´	north	84	6	.0071
1988	Mora´	north	180	3	.0017

In the last two villages where familiar analysis was performed, no correlation has been evidenced among seropositive mothers and respective children indicative for perinatal transmission. The highest prevalence was documented in 1986 in a large urban area (80.000 inhabitants).

M.G.P.10 PREVALENCE OF ANTI HIV ANTIBODIES IN A SAMPLE OF THE GENERAL POPULATION.

Torres-Mendoza, Blanca*; Vázquez-Valls, E.* and Jauregui-Ríos, ML.*
*Instituto de Patologia Infecciosa y Experimental "Dr. Fco. Ruiz Sánchez" de la Universidad de Guadalajara, Guadalajara, Jalisco, México.

Objective. To determine and evaluate the seroprevalence of anti HIV antibodies in voluntary population, from Guadalajara, México.
Methods. The first of december of 1988, a serum sample was taken from 76 volunteer persons that resorted to an information center located downtown in the city of Guadalajara, they were processed by the ELISA assay and the ones that were positive were repeated by the same technique confirming them by means of indirect immunofluorescence assay and/or Western Blot. A questionaire with oriented epidemiologic data was applied when the person picked up their results.
Results. The sample was constituded by 65 male individuals and 11 females whose ages fluctuated between 18 and 55 years. Four (5.2%) were found positive, all of them belonging to the male sex, only 33 persons (43.4%) came to pick up their results, of these 25% had AIDS risk factors.
Conclusions. Independently of the slope that these kind of samples have, the prevalence obtained was high. For this reason we believe that information booths and voluntary tests should be done more frecuently, specially in different strategic points of the city, as complement help for the authorities of public health.

M.G.P.11 GEOGRAPHIC AND RISK-GROUP PATTERNS OF HIV INFECTION IN AFRICA

Peter O. Way*, Smeller, V.-P.**, and Lyerly, W.H.***
*US Bureau of the Census, Washington, DC, USA, **Washington, DC, USA, ***US Agency for International Development, Washington, DC, USA

Objective. To describe the geographic and risk-group patterns in the epidemic spread of HIV-I and HIV-II in African countries.
Methods. The Bureau of the Census maintains a microcomputer-based interactive database of information on HIV seroprevalence and AIDS in developing countries. Information in the database is drawn from medical and scientific literature, presented in papers or poster sessions at conferences, and available information from the popular press. The most recent reliable data on the geographic distribution and risk-group patterns of infection from African countries were selected for this report.
Results. Results of this investigation are presented in a series of maps. Choropleth maps are used to show the relative levels of infection in urban high-risk (e.g., prostitutes), urban low-risk (e.g., pregnant women), and rural low-risk populations, by country, for all of Africa. Similar maps show the distribution of HIV-I and HIV-II infection, especially in West Africa. The diffusion of the epidemic throughout the country is also important. For selected subregions of the continent, proportional circle maps are used to show the distribution of levels of infection through the country.
Conclusions. The pattern of HIV infection in Africa is far from even. The center of infection in virtually all countries is the population of large urban areas, especially those engaged in high-risk behavior. Considerable variation is noted within some countries, with isolated areas of high infection surrounded by lower infection levels.

M.G.P.12 STUDY OF HIV-1, HIV-2, AND HTLV-I IN HOMOSEXUALS IN BRAZIL

Cortes, Eduardo*; Detels, R.**; Slamon, D.**; Aboulafia, D.**; Li, X.L.***; and Ho, D.D.*** *School of Medicine, Federal University of Rio de Janeiro, Brazil. **University of California at Los Angeles (UCLA), Los Angeles, California, U.S.A. ***Cedars-Sinai Medical Center, Los Angeles, California, U.S.A.

Objective. To investigate seroprevalence of retroviruses (HIV-1, HIV-2, and HTLV-I) in Brazilian male homosexuals and to study patterns of retrovirus transmission in Brazil.
Methods. Antibodies against HIV-1, HIV-2, and HTLV-I were tested by ELISA and confirmed by immunoblot and radioimmunoprecipitation assays in 59 male homosexuals in Rio de Janeiro, recruited directly in bars and clubs. Information on demographics and AIDS-associated practices was obtained by interview and questionnaires.
Results. HIV-1 was found in 19% and HTLV-I in 5% of the subjects. One individual had antibodies to both HIV-1 and HIV-2; he was not an IV drug user. Antibodies against HIV-1 and HTLV-I were found in another subject (2%). Median age was 33 (17-70). Median number of partners/week was 2 (1-20). None of the interviewed subjects was an IV drug user or a prostitute. Fifty-three percent never used condoms and only 7% reported using condoms always. Multivariate analysis for significance of the different variables was done using log linear models.
Conclusion. HIV-1 and HTLV-I are prevalent in homosexual males in Rio de Janeiro, Brazil. HIV-2 has already been introduced in the homosexual community in Brazil.

M.G.P.13 STUDY OF HIV-1, HIV-2, AND HTLV-I IN FEMALE PROSTITUTES IN BRAZIL

Cortes, Eduardo*; Detels, R.**; Slamon, D.**; Aboulafia, D.**; Li, X.L.***; and Ho, D.D.*** *School of Medicine, Federal University of Rio de Janeiro, Brazil. **University of California at Los Angeles (UCLA), Los Angeles, California, U.S.A. ***Cedars-Sinai Medical Center, Los Angeles, California, U.S.A.

Objective. To investigate human retroviruses, seroprevalence, and transmission patterns in female prostitutes in Brazil.
Methods. A total of 187 prostitutes were studied in 2 states: 101 in brothels in Rio de Janeiro (34 lower- [LCP], 77 middle- [MCP], and 47 upper-class prostitutes [UCP]) and 86 prostitutes in roadside and other brothels in rural areas (RAP). Sera and a questionnaire with information on demographics and practices associated with AIDS were obtained. HIV-1, HIV-2, and HTLV-I were tested by ELISA, immunoblot and radioimmunoprecipitation assays.
Results. HIV-1 was found only in LCP in Rio (9%). HIV-2 was not found. HTLV-I was found in UCP (4%) and LCP (6%) in Rio, and in RAP (1%). Less than 2% of prostitutes were IV drug users; none of HIV infected LCP were IV drug users. Illiteracy was noticed in 20% of LCP, but none in UCP. Median number of different partners/week was 20 for UCP and MCP, 43 for LCP, and 15 for RAP. Log linear analysis identified significance in several variables studied.
Conclusion. HIV-1 was prevalent only in LCP. IV drug use was not a significant pattern of HIV transmission in prostitutes in Brazil. HTLV-I is present also in rural areas in Brazil.

M.G.P.14 SEROPREVALENCE OF HIV-1, HIV-2, AND HTLV-I IN BRAZILIAN BISEXUAL MALES

Cortes,Eduardo*; Detels,R.**; Slamon,D.**; Aboulafia, D.**; Li, XL.*** and Ho, D.***.
*School of Medicine, Federal University of Rio de Janeiro, Brazil, **University of California at Los Angeles (UCLA), U.S.A., ***Cedars Sinai Medical Center, Los Angeles, California, U.S.A.

Objective. To study the seroprevalence of HIV-1, HIV-2, and HTLV-I in bisexual males from Rio de Janeiro, and their role in the retrovirus transmission to the heterosexual community in Brazil.
Methods. Fifty eight bisexual males, recruited in gay bars and clubs were interviewed for demographic information and practices related to retrovirus transmission. Sera were tested for antibodies against HIV-1, HIV-2, and HTLV-I by ELISA, and confirmed by immunoblots and radioimmunoprecipitation assays.
Results. Seroprevalence was 28% for HIV-1 and 7% for HTLV-I; one individual had antibodies to both HIV-1 and HTLV-I. No HIV-2 was found. Twenty one men were prostitutes; 7 (33%) of these were HIV-1 positive. 49% of bisexuals never used condoms. Median number of partners/month was 19 (prostitutes) and 4 (non prostitutes); 60% of the sexual partners were men and 40% women. No current IV drug use was reported. Multivariate analysis of different variables, was done using log linear models.
Conclusion. The studied bisexuals have a high HIV-1 and HTLV-I seroprevalence, and may be an important bridge for HIV infection between the homosexual and heterosexual communities in Brazil.

M.G.P.15 SEROPREVALENCE OF HIV-1 IN EMERGENCY ROOM PATIENTS IN BRAZIL

Cortes,Eduardo*,**; Lourenco, R.**; Lima, M.**; Huang L.**; Vianna, R**.; Nogueira, C**.
*School of Medicine, Federal University of Rio de Janeiro (UFRJ), Brazil, **UFRJ University Hospital, Rio de Janeiro, Brazil.

Objective.To study seroprevalence and routes of HIV-1 transmission in emergency room patients.
Methods. 163 patients were recruited in the adult emergency room of the UFRJ Hospital. Information on demographics and practices related to HIV transmission was obtained by a questionnaire. HIV-1 antibodies were tested by ELISA and confirmed by immunoblot.
Results. Fifty one percent of participants were male (M) and 49% female (F); they were white (52%), black (21%) and mixed(22%); median age in years was 45.5 for M and 33.1 for F. 26% had blood transfusions. 97% were heterosexuals; median number of partners/month was 1.6(M) and 1.1(F).22% of M had contact with prostitutes in the past 10 years. Sexually transmitted diseases were seen in 38% M and 12% F. 90% of sexually active single people never used condoms. Three (2%) subjects, 2 M and 1 F, had antibodies to HIV-1. All were heterosexuals, without contact with HIV infected individuals, IV drug use, or blood transfusions. Significance of the variables collected was determined by log linear models.
Conclusion. HIV-1 is reaching non risk population for AIDS in Brazil. Preventive measures to avoid HIV infection are not widely used by the population studied.

M.G.P.16 HIV-2 INFECTION IN PRENATAL WOMEN IN GUINEA-BISSAU

Andreasson, Per-Åke*; Dias, F.*.; Teixeira Goudiaby, J.M.*; Nauclér, A.** and Biberfeld, G.**. *Laboratorio Nacional de Saude Publica, Guinea-Bissau. ** National Bacteriological Laboratory, Stockholm, Sweden.

Objective. To determine the prevalence of HIV-2 infection among antenatal women in various regions of Guinea Bissau and the rate of vertical transmission of the infection.
Methods. Sera from prenatal women in the capital Bissau and in 5 regional capitals and sera from children of seropositive mothers were tested by HIV-$2_{SBL6669}$ ELISA. Positive sera were confirmed by Western blot.
Results. 6,9% of 1892 women in Bissau were HIV-2 seropositive. The HIV-2 seroprevalence ranged from 3,1 to 13,2% among women from various parts of the city. The seropositivity rate increased with age from 2,5% in women less than 17 years old to 13,4 in women older than 33 years. In the 5 regional capitals the seropositivity rates were 2,1% (5/237), 3,6% (9/253), 7,0 (18/258), 3,4% (5/145) and 3,6% (7/196). All of 9 children of seropositive mothers followed up for more than 12 months after birth were seronegative.
Conclusion. The seropositivity rate among prenatal women varied considerably between different parts of the capital and between different regions. Follow-up of additional children which is in progress will allow conclusions about the vertical transmission rate.

M.G.P.17 CHILEAN NATIONAL HIV LABORATORY NETWORK

Sánchez G.; Muñoz G.; Vera L.; Soto G.
National Public Health Institute, Santiago, Chile

Objetive: To stablish the usefullnes of a national laboratory network on HIV diagnosis and to show results obtained at the national HIV reference Center.
Methods: A questionaire was done and,according to its results, laboratories were classified in differents levels, depending on their implementation. Training and resources were given when needed.
Only one national HIV reference center was stablished and all doubtful or positive specimens must be sent for confirmation.
Results: The network is composed of 49 public and 23 private blood bank and laboratories in which HIV antibodies detection is performed with a monthly average of 20.000 blood donnors.
874 samples were studied at the national HIV reference center from june, 1987 to december, 1988 (Table I).

Period	Samples		Positive S.		Negative S.		Indeterminate S.	
	Nº	%	Nº	%	Nº	%	Nº	%
Jun/Dec 87	188	100	108	57.4	79	42.0	1	0.53
Jan/Dec 88	216	160	92	42.6	106	49.1	18	8.3
Jul/Dec 88	470	100	165	35.1	277	58.9	28	6.0

High risk groups distribution and seroprevalences will be fully discussed.
Conclusion: This national laboratory network allows proficency laboratory evaluation and makes a better use of limited recources, securing an acceptable quality standar diagnosis.

M.G.P.18 HIV-1 SEROPREVALENCE IN RURAL ZAIRE

Hardy, Iain*; Green,SR**; Cutting,WAM* and Cranefield,M**. *Univ.of Edinburgh, Edinburgh, Scotland, **Institut Medical Evangelique, Kimpese, Zaire.

Objective. To determine the seroprevalence of HIV-1 in a rural area of Zaire.
Methods. As part of an ongoing perinatal study, based at a rural reference hospital 220 km s-w of Kinshasa, 1485 pregnant women were screened for antibodies to HIV-1. Screening was by Abbott Recombinant HIV-1 EIA, confirmed by Wellcozyme HIV Monoclonal VH 52/53 ELISA. 1000 blood donors were screened with the Cambridge Bioscience Latex Agglutination (LA) test, with EIA confirmation.
Results. Pregnant women: 48/1485 (3.2%) HIV-1 antibody positive (HIV+). If women from distant large towns are excluded there were 41/1422 (2.9%) HIV+. Age varied from 14 to 48 years, with mean 26 yrs for both HIV+ and HIV- women. HIV- women were more often monogamously married; HIV+ women, single ($p<0.01$). Mean parity (3) was the same for both groups. Educational level of both HIV+ women and their partners was higher ($p<0.025$, $p<0.01$ respectively). Women who were partners of chauffeurs or small businessmen were twice as likely to be seropositive. Blood donors: 55 positive by LA, 21/1000 (2.1%) confirmed HIV+ with ELISA. The false positive rate for the latex test was therefore 61.8%.
Conclusion. The prevalence of HIV-1 infection in two asymptomatic adult groups in this rural area of Zaire is 2.9% of pregnant women and 2.1% of blood donors.

M.G.P.19 ANTI-HIV 1 TESTING IN BLOOD BANKS IN ECUADOR

Leoro-Monroy, Galo*; Merino, M.L.*; Sanchez, M.*; Herdoisa, M.*; Herrera, C.*; Chiriboga, R.*; and Weilbauer, F.*
*Ecuadorian Red Cross, Quito, Ecuador.

Objective: To analyse the prevalence of HIV 1 infection in voluntary blood donors and other subgroups tested at the Red Cross Serology Laboratory in Quito.
Methods: ELISA screening confirmed by Western Blot on all voluntary blood donors from Quito and 13 provincial cities from Sept. 1986 to Dec. 1988 and on other subgroups of high and low-risk behaviors during 1988.
Results:

Year	#Tested (blood donors)	Initial Positive	Repeat Positive	W.B. Positive	Percent Positive
1986	6524	4	2	2	0.031
1987	20282	60	12	0	0.000
1988	25358	16	11	0	0.000
Total	52164	80(.15%)	23(.04%)	2	0.004

Group	#Tested	ELISA Pos.	W.B. Pos.	% Pos.
Military recruits and other institutional personel	7187	3	0	0
Homosexuales, bisexueles	26**	15	15	57.7
Prostitutes	100	1	0	0
Hemophiliacs	57	1	1	0.6
Sexual promiscuity	91	0	0	0
Intravenous drug addicts	3	1	1	33.3

Conclusion: Low-risk behavior groups as exemplefied by voluntary blood donors and military recruits present with very low prevalance rates for HIV 1 infection. Prevalance is significantly high for homosexual and bisexual males.
**patients referred for suspect HIV infection.

M.G.P.21 DYNAMIQUE DE L'INFECTION A VIH 1 EN GUYANE FRANCAISE DE 1978 A 1987

Pradinaud, R.*; Levadoux, M.**; Fleury, Hervé J.A.**.
* Service de Dermato-Vénéréologie, Centre Hospitalier de Cayenne, Cayenne, Guyane Française.
** Laboratoire de Virologie, CHR de Bordeaux et Université de Bordeaux II, Bordeaux, France.

Objectif. Evaluer la dynamique de l'infection à VIH 1 dans les différentes ethnies et selon les groupes à risques entre 1978 et 1987 en Guyane Française.
Méthodes. A partir de 1985, des recherches sérologiques d'anticorps anti-VIH 1 ont pu être entreprises par ELISA (ELAVIA Diagnostics Pasteur, EIA Abbott), et confirmées par RIPA (F. Barré-Sinoussi, J.C. Chermann, IP Paris) puis par Western Blot (Diagnostics Pasteur). En outre, des sérologies rétrospectives (de 1978 à 1985) ont pu être réalisées par ces mêmes techniques grâce à la sérothèque de l'Institut Pasteur de Cayenne.
Résultats. Ils indiquent que l'infection a débuté dès 1979 chez les Haïtiens immigrés pour diffuser ensuite chez les Créoles guyanais ; à partir de 1985, les autres ethnies (Dominicaines, Boni, Saramaka, Martiniquais, Surinamiens, Brésiliens, Européens, Indiens, Créoles anglais) sont progressivement concernées. Jusqu'en 1984, il s'agit d'une contamination essentiellement hétérosexuelle ; à partir de 1985, on commence à détecter l'infection chez des enfants (transmission materno-foetale), de très rares toxicomanes hétérosexuels, quelques rares homosexuels et un seul transfusé.
Conclusion. L'infection par le VIH 1 a débuté en Guyane dès 1979 chez les Haïtiens pour diffuser ensuite aux autres ethnies et plus particulièrement aux Créoles guyanais ; la voie majeure de contamination reste l'hétérosexualité, les autres modes d'infection étant rarement observés.

M.G.P.23 AN EPIDEMIOLOGICAL REVIEW OF HIV IN ZAMBIA.

Tembo,George;Hira,s.
University Teaching Hospital,Lusaka,Zambia.

Objective: To review epidemiological studies on HIV and outline needs and priorities for epidemiological research in Zambia.
Methods: All epidemiological studies in Zambia were reviewed. Needs and priorities were identified and outlined.
Results: The prevalence of HIV seropositivity is 5-10% for blood donors, 10% in antenatal women, 30-40% in STD patients, 10-30% in prisoners and about 40% in tuberculosis patients. The applicability of the WHO clinical definition of AIDS, various forms of transmission and their rates and the role of predisposing factors in the transmission of HIV are discussed. In addition all other epidemiological aspects of HIv in Zambia are discussed.
The following areas have been identified for future research;
1) HIV transmission in high risk groups like prostitutes.
2) Use effectiveness of condoms with or without spermicides.
3) Role of STDs in the acquisition of HIV infection.
4) Transmission of HIV in the health care setting.
5) Sentinel surveillance of HIV infection in all provinces of the country.
6) Behavioral and social science research.
Conclusion: Although the epidemiological trends of HIV in Zambia are somewhat similar to those in other African countries, there are some subtle differences. More epidemiological research needs to be done in some areas so as to give a clear understanding of the epidemic.

M.G.P.20 SEROPREVALENCE OF HIV-1, HIV-2, AND HTLV-I IN MALE PROSTITUTES IN RIO DE JANEIRO, BRAZIL

Cortes,Eduardo*; Detels, R.**; Aboulafia, D.***; Li,S.****; Slamon, D.*** and Ho D.****.
*School of Medicine, Federal University of Rio de Janeiro, Brazil,**University of California at Los Angeles (UCLA), U.S.A.
***Cedars Sinai Medical Center, Los Angeles, U.S.A.

Objective. To study seroprevalence and transmission patterns of HIV-1, HIV-2, and HTLV-I in male prostitution areas in Brazil.
Methods. Thirty three prostitutes were recruited in prostitution areas in Rio de Janeiro;information on demographics and practices related to AIDS was obtained in a questionnaire. Antibodies against HIV-1, HIV-2, and HTLV-I were tested by ELISA, and confirmed by immunoblot, and radioimmunoprecipitation assays.
Results. 64% of the prostitutes were bisexuals (BS) and 36% were homosexuals (HS). The number of sexual partners/month was 19 for BS and 64 for HM.Receptive (RC) and insertive (IN) anal sex were practiced by HS (76% RC, 24% IN) and BS (14% RC, 86% IN). 47% of sexual partners of BS were women and 53% were men. None of the prostitutes was using condoms always;no IV drug use was reported. Seroprevalences: HIV-1 43%, HTLV-I 7%,HIV-1 + HTLV-I 3%;HIV-2 was not found.Log linear models was used for multivariate analysis.
Conclusion. HIV-1 and HTLV-I are prevalent in male prostitutes in Brazil. IV drug use is not prevalent in the studied population. Bisexual prostitutes may be an important bridge for retrovirus infection from the homosexual to the heterosexual population.

M.G.P.22 HIV SEROPREVALENCE IN EGYPT: A TWO AND A HALF YEAR SURVEILLANCE

Constantine, N.*; Sheba, F.**; Amer, H.**; Watts, Douglas*; El-Bermawy, H.**; Khashaba, S.**; et al.
*US Naval Medical Research Unit No. 3 (A WHO Collaborating Center for AIDS), Cairo, Egypt, **Ministry of Health, Arab Republic of Egypt

Objective. To determine the prevalence of HIV-1 infection among high risk groups, foreigners, and blood donors in Egypt over two and a half years.
Methods. From April 1, 1986 through October 15, 1988, 19,767 blood samples were collected from individuals of 28 Governorates in Egypt and were screened for antibodies to HIV-1. Risk groups included: drug addicts, prostitutes, patients with STD or FUO, blood product recipients, mental patients, travelers, and contacts of infected persons. Foreigners and routine blood donors were tested also. Sera which reacted repeatedly by commercial ELISAs were assessed by western blot (DuPont) for confirmation.
Results. Of the 19,767 sera, 139 (0.70%) produced repeatedly reactive results by ELISA. By western blot analysis, 69 were confirmed as HIV sero-positive. This constituted .35% of the total population tested, but only 26 (.13%) of the high risk Egyptians were positive. The distribution of positives were: foreigners: 43 (.21%), drug addicts: 2(.01%), STD: 4 (.02%), travelers: 1 (.005%), contacts: 2 (.01%), and blood product recipients: 17 (.08%). All blood donors were non-reactive, as were individuals from other risk groups.
Conclusion. In this two and a half year HIV serosurvey including high risk groups in Egypt, the prevalence of HIV confirmed positive cases was exceptionally low. Epidemiological data indicate that HIV is not endemic in Egypt since all 26 sero-positive Egyptians were linked to HIV exposure abroad.

(Supported by NAVMEDRSCHDEVCOM, Beth., Md, WU No. 3M463105.H29.AA.335.)

Prévalence : VIH et autres maladies
Prevalence: HIV and Other Diseases

M.G.P.24 HIV-1, HIV-2 AND TUBERCULOSIS (TB) IN ABIDJAN, COTE D'IVOIRE

Braun, Miles*; Mamadou, T.**; Damet, G.***; De Cock, K.****; Krebs, J.*; Bretton, R.**; et al.
*Centers for Disease Control, Atlanta, GA., USA; **Centres Antituberculeux, Abidjan; ***Institut Pasteur, Abidjan; ****Projet Retro-CI, Abidjan

Objective. To study the relationship between HIV-1, HIV-2 and clinical TB.
Methods. In 1987-88, 338 TB outpatients (all with sputum smears positive for acid-fast bacilli) were clinically evaluated and tested for HIV-1 and HIV-2 by ELISA; repeatedly reactive specimens were confirmed by Western blot. Controlling for age by a log-linear model, the HIV serostatus of 244 male TB patients was compared to 150 similarly tested male blood donors.
Results. For TB patients, 259(77%) were HIV-, 40(12%) HIV1+, 9(3%) HIV2+ and 30(9%) HIV1+2+. Age, nationality, marital status, and quantification of AFB did not differ by HIV serostatus. M:F ratios were 2.6 for HIV-, 3.9 for HIV1+, 8.0 for HIV2+, and 29.0 for HIV1+2+ (p=.02). Mantoux tuberculin skin tests were negative (<10mm) in 25(17%) of 146 HIV-, compared to 8(44%) of 18 HIV1+, 2(40%) of 5 HIV2+, and 2(12%) of 17 HIV1+2+ (p=.02). Criteria for a simplified WHO AIDS clinical case definition (excluding cough) were met by 8(6%) of 143 HIV-, 8(47%) of 17 HIV1+, 1(17%) of 6 HIV2+, and 7(39%) of 18 HIV1+2+ (p<.001). HIV1+2+ serostatus was significantly associated with TB when compared to blood donors, 29(12%) vs 4(3%) (p=.03); for HIV1+, 30(12%) vs 12(8%) (p=ns); for HIV2+, 8(3%) vs 5(3%) (p=ns).
Conclusion. These data suggest that HIV1+2+ seroreactivity is associated with TB and a clinical picture similar to AIDS. Whether HIV1+2+ patients are dually infected remains to be determined. There was no association between HIV2+ and TB, but the number of HIV2+ patients was small.

M.G.P.25

HIV1 ET HIV2 PARMI LES TUBERCULEUX DU CENTRE ANTITUBERCULEUX ET DU SERVICE DE PNEUMOPHYSIOLOGIE DU C.H.U. DE COCODY (ABIDJAN)

GERSHY-DAMET G.M.*, TRAORE M.**, OUATTARA S.***, ASSOA A.*, SORO B.N.****, KOFFI K.*, BRETTON G.**, SANGARE A.*, COULIBALY N***, EHOUMAN A*.

*.- Institut Pasteur de Côte d'Ivoire. **.- Centre Antituberculeux Abidjan ***.- Centre Hospitalier Universitaire de Cocody. ****.- Institut National de Santé Publique.

Les virus HIV ont été mis en évidence en Côte d'Ivoire depuis 1986. La séroprévalence parmi les patients tuberculeux, a pu être déterminée dans deux échantillons différents : l'un constitué de malades visitant un centre antituberculeux d'Abidjan, l'autre représentant des malades présentant une tuberculose pulmonaire grave nécessitant une hospitalisation dans un service de pneumophysiologie.
Sur 316 malades du centre antituberculeux, on note 71 séropositifs (22,4%) confirmés alors que chez les malades du centre hospitalier universitaire, on observe 104 séropositifs (32,0%) confirmés. Il ressort de cette étude un taux de prévalence vis-à-vis du HIV assez élevé chez les malades tuberculeux. L'association entre tuberculose et infection à HIV démontrée aux Etats-Unis et en Afrique est retrouvée ici.

M.G.P.26

TUBERCULOSE ET INFECTION A VIH A BOBO-DIOULASSO (BURKINA FASO)

Malkin, J.E.* ; Prazuck, Th.¨; Simonnet, F.**
Traore, E.*** ; Tiendrebeogo, H.**** ; Dublanchet, A.* ; Deborne, B.* ; Vincent-Ballereau, F.* ; Lafaix, Ch.*.
* GEEP, Bobo-Dioulasso (Burkina Faso) et Villeneuve St Georges (France)
** Service de lutte antituberculeuse, Bobo-Dioulasso. *** Direction provinciale de la Santé, Bobo-Dioulasso. **** Comité National de lutte contre le SIDA, Ouagadougou.

Ojectif : Evaluation du taux de séropositivité de l'infection à VIH dans une population de tuberculeux au Burkina-Faso.
Méthodes : Un échantillon de 96 tuberculeux traités à l'hôpital de Bobo-Dioulasso ont été étudiés. Les sérums ont été examinés en ELAVIA 1 et 2 ou en ELAVIA mixte (Institut Pasteur Production). Tous les sérums positifs par la méthode ELISA ont été testés en WESTERN-BLOT (WB) pour confirmation.
Résultats : 20 sujets ont été positifs en ELISA. 12 ont été confirmés en WB : 8 VIH-1 ; 1 VIH-2 ; 3 doublement positifs VIH-1 et VIH-2. 5 sujets positifs en ELISA ne présentaient pas, en WB, les critères de positivité pour VIH-2 et/ou VIH-2.
Conclusion : 12,5 % de la population étudiée s'est révélée positive en VIH-1 et/ou VIH-2. Cette étude confirme la séroprévalence élevée des VIH chez les tuberculeux en Afrique et incite à poursuivre le dépistage pour les deux virus dans cette région.

M.G.P.27

EARLY INFANT MEASLES: ASSOCIATION WITH MATERNAL HIV INFECTION

Joanne Embree*; P Datta**; L Sekla***; M Braddick****; J Kreiss*; J Ndinya-Achola**; F Plummer*** et al. * U Washington, Seattle, USA; ** U Nairobi, Nairobi, Kenya; *** U Manitoba, Winnipeg, Canada; **** Middlesex Hospital, UK.

Despite immunization efforts, measles causes significant infant morbidity and mortality in developing countries. An association between maternal HIV infection and increased risk of measles infection in infants prior to the current scheduled measles immunization (9 months of age) was seen in infants in an ongoing perinatal HIV transmission study in Nairobi, Kenya.
Results: Five (8%) of 62 infants of HIV+ mothers followed past 9 months of age developed measles prior to measles vaccination vs none of 89 controls (p=0.01). Age at measles illness ranged from 6 to 8½ months. One died, 3 were hospitalized, all survivors had slowed growth after measles, and 2 of 2 tested had an antibody response to measles. All participants were from lower socio-economic families. No increased exposure was seen in families of those developing measles (mean no. of household members was 3.6 vs 4.2 in other HIV+ and 4.8 in HIV- families, range 2-10). Two of 3 mothers tested by ELISA and HAI whose infants had measles had either no or borderline immunity to measles at partuition; 14 of 14 HIV+ and 18 of 19 HIV- mothers whose infants did not get measles were immune.
Conclusions: Decreased passive infant immunization and/or other undetermined factors may increase the risk of measles in infants of HIV+ mothers before scheduled measles vaccination. The HIV epidemic accentuates the need for improved measles vaccines which can be administered to young infants at an earlier age.

M.G.P.28

SPECIFIC ANTIBODI RESPONSE TO PLASMODIUM FALCIPARUM SCHIZONTS IN ZAMBIAN CHILDREN WITH HIV I INFECTION AND THEIR HOSPITAL CONTROLS.

Rosemary Musonda Mwendapole, Tropical Diseases Research Centre, Ndola, Zambia.

Objective: To assessand compare the specific anti IgG antibody response against Plasmodium falciparum malaria in infants and children with HIV I infection and HIV negative children living in an endemic area of Malaria.
Methods: Serum samples collected from thirty anti HIV I positive children between the age of 1 month to 5 years presenting with symptoms suggestive of AIDS or ARC and sixty sera from matched HIV negative hospital controls were tested for the presence of specific anti IgG antibodies to Plasmodium falciparum schizonts using the Indirect fluorescence antibody test. The cut off point for positivity was titres 1:80.
Results: The prevalence of antibodies to P.falciparum in HIV infected children was lower (43%) than their controls who were HIV negative (63%), but the difference was not statistically significant at the 5% level. A large proportion of children with antibodies to Plasmodium falciparum was between 1 and 5 years in both HIV positive and HIV negative children.
Conclusion: There was no apparent failure of the humoral Immune response to Plasmodium falciparum malaria in infants and children under five years presenting with symptoms suggestive of AIDS or ARC.

M.G.P.29

HIV IN VARIOUS RISK COMMUNITIES IN THE NORTH EAST OF ARGENTINA

Fay,Oscar* **;Biglione,J**;Fernández,E**;Galíndez,J**;
Guagnino,L**;Navarret,N**,et al.
*Centro de Tecnología en Salud Pública,Universidad Nacional de Rosario,**Comité Prevención SIDA (COPRES),Rosario,Argentina.

Objective. To study HIV prevalence on various populations in the North East of Argentina (NEA).
Methods.Spontaneous consultation arising from COPRES and samples sent from the NEA. Blood bank figures are those provided by participant centers. Serologic studies were performed thru ELISA and confirmed thru IFA and W.B.
Results.In the high-risk group,our studies show an HIV-1 prevalence of 30% in IVDA(219/736),8% in homosexuals(56/504),33% in female-partners of HIV+(17/52), 30% in male-partners of HIV+ females(8/27);in low-risk subjects,the seroprevalence of 2% in prostitutes(12/627),15% in dialyzed patients(25/165),0.6% in inmates and prison personnel(21/3,761),0.1% in patients of a psychiatric clinic and 23% in polytransfused patients(9/40),0.16% in voluntary blood donors(87/51,895);no positive results were found among 165 health care workers,116 Tuberculosis patients and 23 individuals relatives of AIDS persons.
Conclusion.Preliminary studies show that:1)regarding serologic prevalence,the greatest HIV impact is within IVDA(47%);2)the homosexual group shows a gradual increase in positiveness,perhaps due to their growing trust as the system gains in privacy and secrecy and,accordingly,their more frequent spontaneous consultations;3)for like reasons,the number of spontaneous visits of prostitutes is remarkable as well as a positive percentage of 2.3% for the last quarterly period;4)followed up couples where one of the members was positive enabled record of both types of transmission, i.e., male-female and female-male.

M.G.P.30

THE IMPRINT OF APARTHEID ON HIV/AIDS IN SOUTHERN AFRICA

Orkin, Andrew* and O'Meara, Dan** *McGill Centre for Medicine, Ethics and Law **Université du Québec à Montréal Montreal, Quebec, Canada

Objective. To identify general and unique socio-economic, legal and political factors in Southern Africa which may peculiarly affect the impact of and strategies to prevent HIV/AIDS amongst the 110-120 million inhabitants of the region.
Method. Review of applicable medical and social science literature and analysis of socio-political conditions in 11 Southern African countries.
Results. 1. (a) Data on the incidence and impact of HIV/AIDS in Southern Africa are "woefully incomplete". (b) Available data indicates uneven seroprevalence between countries, with highest rates (up to 21%) in northern Southern African states. (c) A "downward migration" of pattern II HIV/AIDS from Central Africa is reported. (d) In South Africa two HIV/AIDS epidemics are identified (pattern I for whites, pattern II for blacks).
2. Apartheid, internationally condemned as an illegal system, allows the political, social and/or economic domination of the Southern African subcontinent by a racial minority. It engenders throughout Southern Africa various socio-political features relevant to the HIV/AIDS epidemic: (a) regional economic dependence on South Africa reproduces underdevelopment in black states; (b) significant flows of temporary migrant labour to and within South Africa skew rural/urban gender ratios, undermine family units and foster sexual practices conducive to the spread of STDs; (c) inequitable distribution of wealth produces social conditions which enhance the spread and impact of otherwise controllable diseases; (d) acute political tension and social unrest inhibit flows of data and the diffusion and credibility of official information; (e) sustained South African destabilization has damaged or destroyed social, civil and economic structures in neighbouring black states; (f) forced removals in South Africa and refugee flight in the region have produced massive population displacements; (g) medical and social services in South Africa are provided on a racially discriminatory basis; (h) South Africa has a history of official denial of other morbidities.
Conclusion. The imprint of apartheid on the HIV/AIDS epidemic (a) fosters conditions certain to accelerate the spread of HIV/AIDS and maximize its impact on racially selected populations; (b) make it extremely unlikely that an epidemiological profile of HIV/AIDS can be developed; (c) seriously impairs regional capacities to implement and deliver strategies for effective HIV/AIDS prevention and care.

M.G.P.31

AIDS IN THIRD WORLD COUNTRIES : A GEOMEDICAL STUDY

Dr.S.Shanmuganandan *, Dr.P.T.K.Subramanian **
* Department of Geography, Madurai Kamaraj University,Madurai-625002,
** Department of Medicine, Madurai Medical College, Madurai-625020,India

AIDS is the biggest health problem and there is yet no curative drug or protective vaccine available to combat AIDS. AIDS infection became pandemic by the mid- to late 1970 s and it was silent and unnoticed. The present study has made an attempt to analyse the spatialdistribution of AIDS with reference to epidemiological, ecological, socioeconomic and environmental factors. It is observed that the epidemiological situation is precarious in some regions of the Third World such as African parts of Caribbean and Latin America. Cases of AIDS have almost doubled in the Asia-Pacific region. Africa is the leading continent to witness next to America with 11,530 cases. In all 23 Central American and Caribbean countries have reported 1587 cases and 13 South American countries with a total of 2036 cases. It is also inferred that the regions identified to report with a higher prevalence rate are Brazil, The Bahamas, The Dominican Republic, Haiti, Mexico, Trinidad and Tobago. In addition, the countries included are Hong Kong, India, Indonesia, Malaysia, Maldives, The Phillippines, the Republic of Korea, Singapore, Sri Lanka and Thailand.

Stratégies et programmes
Strategies and Programmes

T.G.P.1

THE INTERNATIONAL AIDS ACTIVITIES OF THE UNITED STATES GOVERNMENT Aultman, Kathryn S.* ; Harris, J.R.*; Wells, J.D.** *Agency for International Development, (A.I.D.); ** Department of Health and Human Services (HHS) Washington, D.C., U.S.A.

OBJECTIVE: to describe the current and planned activities of the U.S. Government (USG) to combat the international HIV epidemic.
METHOD: All USG agencies known to be involved in international AIDS activities were surveyed concerning present and projected activities and funding levels.
RESULT: The resulting database contains descriptions and budget information by year, agency, location and type. In FY89 the overall budget is US$69 M; in the previous three years together it totalled US$94 M. The largest share (38%) of the USG FY89 AIDS budget is for the WHO/GPA, and this amount is excluded for the remainder of the analysis. There are presently six agencies engaging in international AIDS activities: four in HHS represent roughly 63% of the FY89 budget, while A.I.D. and the Department of Defense represent about 34% and 3% respectively. Roughly 40% of the activities have a worldwide or regional focus and the remainder are distributed between Africa (32%), Asia and the Near East (9%) and Latin America (19%). Prevention and prevention-related research account for 35% of the FY89 budget; epidemiology and surveillance represent another 34%.
CONCLUSION: The USG is increasingly active in international efforts to control the AIDS epidemic. During FY89 the U.S. government plans to spend almost as much on AIDS as it has done in all of the previous three years combined. Agencies involved in these efforts include both those with a domestic and a foreign policy focus. The geographical distribution roughly parallels the prevalence of HIV infection.

T.G.P.2

THE EPIDEMIOLOGY OF AIDS IN THE AMERICAS
Ronald K. St. John, Maureen Clifford,
Fernando R. K. Zacarías
Pan American Health Organization, WHO Regional Office for the Americas,
Washington, D.C.U.S.A.

Objective. To describe the epidemiology of AIDS in the Western Hemisphere.
Methods. Since 1983, the Pan American Health Organization has carried out surveillance for AIDS. Quarterly data are analyzed to assess trends and define the epidemiological profile of the disease in the Americas.
Results. As of 30 December 1988 a total of 95,881 cases and 51,901 deaths have been reported in the Americas. Four countries, the United States, Brazil, Canada and Haiti, account for 95% of all reported cases. Excluding the United States and Canada, the remaining countries have reported 11,191 cases. Only two countries, the British Virgin Islands and Montserrat, have yet to report a single case of AIDS or HIV infection. We calculated cases per million population by subregion and by country for the years 1986, and 1987. These data demonstrate that the entire Caribbean area has exceptionally high rates of AIDS. In addition, male/female case ratios reveal two patterns of disease: (1) the homosexual/bisexual pattern with a very high male to female case ratio, observed in North America and most South American countries (pattern I); and 2) a second pattern of male to female case ratios of less than 3:1, suggesting increasing heterosexual transmission in a number of Caribbean and Central American countries.
Conclusion. These and other preliminary seroprevalence data indicate clear subregional differences as well as rapidly changing patterns (from pattern I to pattern II) in the epidemiology of AIDS and HIV infection in the Americas.

T.G.P.3

PRIORITIES FOR HIV EPIDEMIOLOGICAL RESEARCH
Karam, Marc; Nkowane, Ben; Biritwum, Richard; Brès, Paul; Beausoleil,E; Mann, Jonathan; Heymann, David.
Regional Office for Africa, and Office of the Director, Global Programme on AIDS, World Health Organization; Geneva, Switzerland and Brazzaville, Congo.

Objective: To identify research priorities and methodologies for the study of the epidemiology of HIV infection in sub-Saharan Africa.
Methods: National AIDS Committees and research institutions were visited in 31 sub-Saharan African countries in order to identify AIDS-related research projects and laboratories presently supporting AIDS research. Principal investigators and heads of laboratories were then interviewed: for investigators, a standard inventory form was completed which included the title and objectives of the study, collaborators or collaborating institutions, study methodologies and preliminary results if available. For heads of laboratories, details about diagnostic testing and equipment available in the laboratory, as well as collaborating laboratories and methods of quality control, were recorded. Information was then computerized. After the inventory and computer data base were completed a series of meetings to review knowledge and gaps in knowledge about specific aspects of AIDS epidemiology in sub-Saharan Africa was conducted. African investigators identified from the computerized inventory, their collaborators from developed countries and other international experts in AIDS epidemiology and research methodology were invited to participate.
Results: Over 400 AIDS-related research projects were identified in sub-Saharan Africa. Systematic review of the objectives and methodologies of these studies as well as of methodologies and results of AIDS research previously reported in the literature, led to identification of incomplete areas of research. Research approaches and methodologies suited to address these areas were identified.
Conclusions: While over 400 AIDS-related research projects are currently being conducted in sub-Saharan Africa, several priority areas for AIDS related epidemiological research, especially in the epidemiology of HIV-2, urgently require attention.

T.G.P.4

IMPACT OF THE HIV EPIDEMIC: EMERGENCY DEPARTMENT RESOURCE UTILIZATION BY PATIENTS WITH KNOWN HIV-1 INFECTION
Kelen, Gabor; Johnson G; DiGiovanna T; Loring K; Sivertson K.
The Johns Hopkins University School of Medicine, Baltimore, Maryland, USA

Objective: To assess the reasons for visits to a large inner-city teaching hospital emergency department (ED) by patients with known HIV-1 infection.
Methods: Data was collected from review of records on all patients with known HIV-1 infection who presented to the main emergency department of the Johns Hopkins Hospital during a 4 month period in 1988.
Results: There were 256 (1.4%) ED visits by 164 patients with diagnosed HIV infection. Among these, 51 carried a diagnosis of AIDS. Of the 256 visits, 130 (51%) became admissions. The most common complaints were cough (25%), fever (25%), malaise (18%), and chest pain (14%). The most common diagnoses were PCP (13%), non infectious neurological disorders (13%) other pneumonias (7%), and sepsis (6%). Of the visits from patients who had a regular source of care, 70% (127/182) occurred during times when these sources were unavailable. HIV infected patients were more likely to have inadequate or no insurance compared to the general emergency population (OR=2.4; p<.01). HIV patients without a regular source of care (50) were more likely to have inadequate or no insurance compared to those who were regularly followed (OR=2.1, p=.05). Based on Illness Severity Scoring, visits with third party coverage (187) were sicker and were thus more likely to result in admissions than visits with inadequate coverage (OR= 3.2; p<.01). Since admissions are based only on severity of illness and not payor status, HIV patients without insurance likely use the ED as their primary source of care for less serious illnesses.
Conclusion: This ED is sought when other sources of care are unavailable, but HIV infected patients are less able to pay for services than others. Adequately subsidized and alternate sources of care are essential to achieve appropriate utilization of emergency services by these complex patients.

T.G.P.5

THE INTERNATIONAL WORKING GROUP ON AIDS AND IV DRUG USE
Des Jarlais, D C*; Friedman, S R **; Woods, Joycelyn Sue**et al.
* State of New York Division of Substance Abuse Services, NY, USA, **Narcotic and Drug Research, Inc., NY, USA

Objectives: To provide timely information to scientists and policy makers the International Working Group on AIDS & IV Drug Use was first organized in early 1986 at an International Conference on AIDS and IV Drug Use in Newark, New Jersey. Later that year in Paris at the II International Conference on AIDS the First Annual Meeting was held and the goals of the organization were formalized .
Method: In late 1987 financial support was received from the National Institute on Drug Abuse (USA). Membership in the organization is free. The International Working Group on AIDS & IV Drug Use has developed the following strategies as a means of exchanging information. A quarterly Newsletter provides a forum for communication. In addition to the Newsletter, specialized data bases have been developed for researchers including: (1) a data base describing current research projects, survey instruments and publications, (2) a quick retrieval file of published abstracts, (3) a data base containing legislation, policy reports, presentations and publications, (4) an international file containing reports, policy papers, posters, pamphlets and correspondence organized by country, and (5) a bibliographic data base of publications from more than 30 journals, books, conference presentations, reports, and unpublished manuscripts.
Results: The membership includes 1,000 scientists and policy makers from over 30 countries. Approximately 20-30 new members join each month. In total, the data bases represent over 3,000 full text records. All the data bases are operational except the Current Studies Data Base, available in Spring 1989 and the Abstract File available by Summer 1989. Presently the organization receives over 30 bibliographic search requests per month from researchers, policy makers and treatment professionals working in IV drug abuse.
Conclusions: The International Working Group on AIDS & IV Drug Use has provided a much needed service for those involved in AIDS and IV drug use. At the Conference we will report on the progress of these databases and future projects under consideration.

T.G.P.6

SEROSURVEILLANCE OF HUMAN IMMUNODEFICIENCY VIRUS (HIV)INFECTION IN TRIBAL POPULATION OF ANDAMAN-NICOBAR ISLANDS,INDIA.

Pradeep Seth,Manas Mukherjee,I.C.Verma,R.Elango,S.Mathew

Department of Microbiology and Paediatrics,All India Institute of Medical Sciences, Ansari Nagar, New Delhi.INDIA

The group of Andaman-Nicobar Islands in the Bay of Bengal is inhabitated by several tribes. Efforts are being made to bring these tribes in the main stream of the nation. Total population of two of the tribes, Andamanis and Onges is 32 & 105 respectively. Population of these tribes is gradually dwindling. They have a high incidence of tuberculosis and skin infections. A survey for viral antibodies revealed that more than 90% of two of the tribes, Andamanis and Onges have antibodies to Measles virus,Polio virus and Rubella virus. In addition 65-75% have antibodies to herpes simplex virus type 2. Therefore, to see whether these tribes have been exposed to HIV,32 sera from Andamanis and 16 sera from Onges have been tested for HIV-1 antibodies by competitive ELISA(Wellcozyme). The positive serum samples were confirmed by Western blot (Du Pont).
It was observed that 5 sera(4 Andamanis and 1 Onges) were found positive by competitive ELISA. By Western blot none of the sera were found positive according to the criteria laid down by Centers for Disease Control. However,one serum sample was strongly positive for anti-p-24 antibodies only. The data suggest that though there is no indication of HIV-1 antibodies in these sera they should be tested for HIV-2 and other retero viruses.

T.G.P.7

DETAILED ESTIMATES OF THE CURRENT AND FUTURE EXTENT OF THE HIV/AIDS PANDEMIC IN SUB-SAHARAN AFRICA

Sato, P.[1*] [1*], Chin, J.[1*], Lwanga, S.[2*], Beausoleil, E.G.[3**]
Mann, J.
* World Health Organization, Geneva, Switzerland
** WHO Regional Office for Africa, Brazzaville, Congo

Objective. To provide country-specific estimates and projections of HIV/AIDS to sub-Saharan countries for public health planning.

Methods. An AIDS projection model based on estimates of HIV seroprevalence and the annual progression rate from infection to AIDS was used.

Results. From the country-specific estimates, we estimate overall in 1987 that there were about 70,000 new AIDS cases in sub-Saharan Africa for a cumulative total since 1980 of about 100,000 cases in adults, and close to 50,000 in children. Approximately 2.5 million individuals are estimated cumulatively to have been infected with HIV in sub-Saharan Africa since 1980. By 1992, we estimate that there will have been a cumulative total of 800,000 AIDS cases in adults, and 200,000 cases in children. In 1992 alone, we estimate that there will be about 250,000 new AIDS cases. This is more than the cumulative total number of AIDS cases in sub-Saharan countries to 1987.

Conclusion. Over the next 4-5 years, we estimate that there will be at least a five-fold increase in the AIDS burden in each of the countries in sub-Saharan Africa.

T.G.P.8

CONTROL OF TRANSFUSION RELATED TRANSMISSION OF HIV INFECTION STRATEGIES OF THE EEC'S AIDS PROGRAMME FOR DEVELOPING COUNTRIES.

van DAM, C.J., MD, MSc; AMAT, T, MD; FRANSEN, L, MD, PHD.
European Economic Community - AIDS Control Programme/Developing Countries. Belgium

Various strategies to reduce the incidence of transfusion related HIV transmission have been developed. These vary from exclusion of high risk behaviour donors and a reduction of the number of transfusions to screening of donated blood for anti-HIV antibodies. A number of these are being implemented with support from the AIDS Task Force of the EEC in various countries in Africa, Latin America and the Caribbean. A choice for a particular strategy or combination of strategies must be made on the basis of an estimate of the costs and expected benefits of such an intervention. This is a function of the prevalence of HIV infection among the population, the existing infrastructure and capability of the health care system, including blood-transfusion services, and the cost of these interventions. Although screening of donated blood is a technical possibility, presently the cost of universal screening is prohibitive in many developing countries.The development of new tests however will influence strategy options. A preliminary analysis of various interventions in different countries is presented.

T.G.P.9

PLANNING A NATIONAL STRATEGY ON AIDS AND INJECTION DRUG USE: LESSONS FROM THE LITERATURE

MacKenzie, Betsy; Elmslie, K. Federal Centre for AIDS,
Health Protection Branch, Ottawa, Ontario, Canada.

Objective: To demonstrate how the literature can contribute to the development of a national strategy on AIDS and injection drug use.

Methods: The presentation will be based on an assessment of the literature (bibliographies will be made available) and specific illustrations from the Canadian experience.

Results: As of January 1989 in Canada, only .8% of a total of 2,337 identified AIDS cases were attributed solely to injection drug use. The prevalence of HIV infection among Canadian injection drug users is not yet known but small studies suggest that currently it is relatively low. The literature offers many lessons for a country that might be tempted to think it will escape the 'second wave' epidemic. Needle-sharing emerges as a widespread cross-cultural phenomenon. Data describing rapidly increasing seroprevalence among injection drug users in Edinburgh, New York and Bangkok signal an urgent need to acquire baseline data and to recognize that any window of opportunity will soon close. Published material testifies to the complexity of the problem and the need for collaborative, multidisciplinary prevention programs. Risk reduction strategies can form the basis of a partnership between public health and addiction services. The effectiveness of interventions remains uncertain, demonstrating the importance of conducting pilot studies with strong program evaluation protocols.

Conclusion: Canada is developing a national strategy to reduce HIV infection among injection drug users emphasizing collaboration, research and innovative program evaluation.

T.G.P.10

MEDIUM TERM PLAN FOR THE CONTROL OF AIDS IN CAMEROON-AFRICA: OCTOBER 1988-SEPTEMBER 1993.

Roger Salla*,L.Kaptue**
*Chief of AIDS Control Service,**President of the National AIDS Committee,
Ministry of Health,Yaounde,Cameroon.

Cameroon has a population of 10 millions and is located in Central Africa. It has borders with Tchad,Central African Republic,Congo,Gabon and Equatorial Guinea.

Data from surveys of the general population of provincial towns in the age group 15-44 show HIV 1 seropositivity rates between 0,3 and 0,8% (mean 0,5%). In prostitutes up to 7% have been found positive.A total of 72 AIDS patients have been notified,including 5 pediatric cases.

The governement has recognized that the AIDS epidemic poses a serious threat to the economic and social development of the country and has decided to give priority to combatting AIDS.A National Programme on AIDS has been approved,based on the global stategies as developped by WHO,with the participation of USAID,FHI,EEC,France,West-Germany and Canada.

A range of activities for the prevention and control of AIDS,integrated in the health care system of Cameroon,have already been initiated.The National Programme on AIDS has seven major components: (a)mass public information and education(b)blood screening establishment and rehabilitation of blood transfusion systems(c)protection of the public,health workers and children(d)establishment of an effective national surveillance system(e)drugs for treatment of STDs and AIDS cases(f)operational research(g)training and orientation of health workers.

T.G.P.11

ELABORATION D'UNE STRATEGIE DE PREVENTION DU SIDA ADAPTEE AU MILIEU DE LA PROSTITUTION ORGANISEE A COTONOU, BENIN.

Verbeke, Ronald* et Monteiro, Bruno**.
*Université de Mons, Belgique,**Université de Cotonou, Bénin.

Objectif: élaborer un message et des modalités de prévention du SIDA adaptés aux caractéristiques socio-culturelles des prostituées de Cotonou, Bénin.

Méthode: nous avons procédé à Cotonou à une enquête comprenant entre autres des entretiens individuels avec 61 prostituées, le repérage de tous les immeubles où vivent et travaillent au moins 4 prostituées, et des entretiens avec 8 tenanciers de tels immeubles.

Résultats: La prostitution organisée, à Cotonou, est le fait de 600 à 800 femmes qui habitent et travaillent à plusieurs dans un même immeuble. Une stratégie de prévention adaptée à ce milieu doit tenir compte notamment des aspects suivants: (1) méconnaissance des risques réels d'infection, croyance en l'efficacité préventive de médicaments et des toilettes intimes, et ignorance de ce qu'est un préservatif et de la manière de l'utiliser; (2) une forte méfiance lors du premier contact se transforme en grande réceptivité si l'entretien a été mené avec tact et chaleur, et de préférence par une femme; (3) 50% des prostituées sont analphabètes; (4) la solidarité qui lie entre elles les prostituées habitant et travaillant sous un même toit peut être utilement exploitée; (5) la collaboration des tenanciers et d'ex-prostituées s'avère aisée et souhaitable; (6) les préservatifs, dont le coût est prohibitif, doivent être accessibles aisément et à faible prix.

T.G.P.12

THE IMPORTANCE OF QUALITATIVE RESEARCH IN DEVELOPING OPERATIONS RESEARCH PROTOCOLS/STRATEGIES FOR GAY AND BI-SEXUAL MEN IN THE DOMINICAN REPUBLIC

Ramah, Michael*; Pareja, Reynaldo**;
*Porter/Novelli/AIDSCOM; **AIDSCOM, Dominican Republic

Objective. To determine to what extent research protocols and strategies must diversify to reach significant substrata of gay and bi-sexual populations.

Method. Focus groups, individual indepth interviews and unstructured gatherings at meeting places (bars, discos, bordellos, coffee shops) were conducted. Options with regard to language, sexual practices, marital circumstances and others were explored.

Results. Initial findings indicate that there does not exist among gay and bi-sexual population a set of universal standards or CODA with regard to above mentioned variables.

Conclusion. Individuals or groups responsible for conducting KAP Surveys or other formative research among these populations will need to carefully assess and understand the premise [illegible]t homosexual is not necessary homogeneous.

T.G.P.13 Contraceptive Social Marketing Principles: Promoting Condom Use in Uganda and Tanzania for AIDS Prevention

D. Stone*, D. Levy**, S. Saunders***
*Johns Hopkins University/AIDSCOM, **Academy for Educational Development/SOMARC, ***Academy for Educational Development/AIDSCOM, U.S.A.

Objective: To apply contraceptive social marketing techniques in promoting condom use for AIDS prevention.

Method: Social marketing techniques are being used in developing condom promotion programs for AIDS prevention in Uganda and Tanzania. They are used to enhance the perceived value and desireability of condoms through branding strategies, audience segmentation, and pricing strategies. Distribution and trade considerations are being addressed, and condoms are being distributed through "AIDS in the Workplace" projects in Uganda & Tanzania.

Results: Using CSM strategies for promotion of condoms for AIDS prevention and Tanzania appears to show an increase in condom acceptability and purchase.

Conclusion: AIDS prevention has stimulated the market for condoms in both Uganda and Tanzania. It appears that condom social marketing for protection from HIV infection may overcome substantial barriers usually found in condom use.

T.G.P.14 FOLLOW-UP OF GROUPS AT RISK FOR HIV INFECTION

Dias,M.R.S.; Lima,J.H.; Abreu,W.B.; Aoki,F.H.; Goncales,N. and Pedro,R.J.
UNICAMP, Campinas, Sao Paulo, Brazil.

An HIV counselling/testing service was created in June 1988 at UNICAMP with three main objectives: a) provide an alternative free HIV testing site coupled with pre and post test counselling; b) set up a longitudinal serologic surveillance to determine the rate of annual seroconversion rate among high risk groups; c) give the blood bank support on confirmatory testing of anti-HIV positive blood donors. Testing is done by an ELISA (recombinant DNA) assay; if positive, a second blood sample is tested by ELISA; if positive, a Western blot test is done for confirmation. If a high risk person tests negative, counselling is emphasized and a 6 month follow-up testing is planned. Up to now, 167 persons have been tested; the table shows the distribution and the percentage who tested positive by at least one ELISA assay.

GROUP	No. TESTED	No. POSITIVE (%)
HOMO & BISEXUAL MEN	49	6 (12%)
IV DRUG USERS	42	18 (43%)
SEX WITH HIGH RISK PERSON	17	1 (6%)
SEX WITH INFECTED PERSON	8	2 (25%)
NON HEMOPHILIAC TRANSFUSION*	7	0 (0%)
NONE OF THE ABOVE RISK GROUPS	44	4 (9%)

* no hemopliliacs were seen at our service

T.G.P.15 EDUCATION AND LAW: THE CONTROL OF TRANSMISSABLE DISEASES THROUGH THE CONTROL OF GOSSIP, IGNORANCE, AND DISCRIMINATION

Traub, Kit, University of Georgia, Athens, Georgia, U.S.A.

Objective: To recall lessons from the history of the control of transmissable diseases and present effective, ethical, and scientific alternatives for the control of AIDS.
Methods: Review controls once applied to leprosy, plague, and syphilis, recognizing their reoccurance in the AIDS debate, and present alternative ways of thinking about diseases, particularly AIDS.
Results: The current generation has an opportunity to confront AIDS, a fearsome "plaque," without adopting dehumanizing rules as in the past with other transmissable diseases. Futile and ineffective gestures accumulate, producing great social damage without alleviating the causes or effects of AIDS. To keep our human perspective, we must first avoid referring to "AIDS Victims," speaking instead of "people with AIDS." Next, we must employ methods of disease control that are simultaneously effective, ethical, and scientific. Both the WHO and the Council of Europe have adopted enlightened, informed guidelines for avoiding discrimination in relation to HIV-infected people and people with AIDS. These efforts have been met by both support and resistance.
Conclusion: Ignorance, fear, and short-term political responses to the AIDS problem are counter-productive to the efforts to control the spread of AIDS. Alternative approaches are demonstrably more effective, while simulataneously preserving the human rights of infected persons and society generally.

T.G.P.16 TRAINING HEALTH WORKERS IN ZAMBIA FOR HIV INFECTION

A. Haworth*, K. Kalumba*, M. Kelly**, A. Chingono***, *University of Zambia, School of Medicine; **Family Health Trust, Lusaka; ***Ministry of Health, Harare, Zimbabwe.

Health workers are increasingly having to inform patients that they are HIV infected or are suffering from an HIV-related illness, yet they rarely have experience or training in counselling; rather, their approach tends to be highly directive, allowing largely of only one-way communication. The use of a World Health Organization training manual is described, in a course consisting of one week's intensive orientation and role-playing exercises, project work carried out after return-to-normal duties, over a period of four weeks, and a further intensive de-briefing and training session lasting three days. Although not all physicians and nurses are able to acquire the necessary skills in this kind of brief, concentrated training, a sufficiently large cadre has been created to form a series of nuclei in various institutions, for further "snowballing" of the training programme in other areas of the country.

T.G.P.17 INTERNATIONAL AIDS PROGRAMS AT THE NATIONAL INSTITUTES OF HEALTH

Bridbord, Kenneth*;Hamburg, M.*;Schambra, P.*;Whitescarver, J.*; Fauci, A.*;*National Institutes of Health, Bethesda, MD., U.S.A.

The presentation will include an overview of NIH international AIDS programs amounting to over $18 million annually. Three programs will be emphasized. The first, the National Institute of Allery and Infectious Diseases program of International Collaboration in AIDS Research, contributes to international health by strengthening scientific linkages between U.S. and foreign investigators in areas with major health problems due to HIV.

The second, the Fogarty International Center (FIC) program of International Postdoctoral Research Training Grants in AIDS, supports collaborative research and training involving American and foreign scientists in the epidemiology, diagnosis, prevention, and treatment of AIDS.

The third, FIC's International Training Grants in Epidemiology Related to AIDS, increases the capability of scientists in developing countries to conduct epidemiologic research related to AIDS and to utilize epidemiology in clinical trials and prevention research. Establishment of an International Network for AIDS Research and Training will also be described.

T.G.P.18 DEVELOPMENT OF THE AIDS EPIDEMIC IN SOUTH AFRICA

Schoub B D*; Martin D*; Johnson Sylvia*; Lyons SF*; Padayachee GN**; Naidoo S.**
*Medical Research Council AIDS Virus Research Unit, National Institute for Virology, Sandringham, South Africa, **Johannesburg City Health Department.

The epidemiology of AIDS in South Africa represents an almost unique model of the intersection of type 1 (Western) and type 2 (African) patterns of AIDS and the dynamics of the epidemic are thus of considerable interest. Data on HIV seroprevalence obtained from a number of sentinel populations and AIDS cases reported voluntarily to the Advisory Group on AIDS have been used to construct a composite of the epidemiology of AIDS in South Africa. Analysis of AIDS data to the end of 1988 still reveals a predominantly type 1 pattern with 75% of 166 reported South African cases occuring amongst white male homosexuals, compared to 14% heterosexuals and 2% paediatric cases. Seroepidemiological data however, indicate a significant and rapidly developing epidemic of HIV infection in the black African heterosexual population, which may soon overtake the type 1 pattern dominating the AIDS profile presently. Thus, while no South African black STD clinic attenders were HIV positive in 1986/87 (Trans Roy Soc Trop Med Hyg 1987, 81: 874-875), at the end of 1988, 1.3% of 1174 black female STD attenders 0.3% of 1395 family planning attenders and 0.1% of 17236 new blood donors (first half of 1988), were confirmed HIV seropositive. In the white population type 1 is still the predominant epidemiological pattern, with low seroprevalences in the general heterosexual population (2 of 334 male heterosexual STD clinic attenders being seropositive while no female STD attenders or family planning clinic attenders were positive and also only 0.03% and 0.007% of male and female new white blood donors respectively).

T.G.P.19

SMALL PARTICLE PERMEABILITY OF USED VERSUS UNUSED SURGICAL RUBBER GLOVES

Goldstein, Andrew; Stokes, K.; Yoshihara, P.; Arya, S.C.. Epitope, Inc., Beaverton, Oregon, USA

Introduction. Surgical latex rubber gloves are repeatedly re-used in many third world countries after being washed and sterilized. A study was conducted to determine whether used and unused surgical rubber gloves are permeable to particles the size of HIV-1.
Methods. Surgical gloves were obtained from several medical facilities in New Delhi, India as well as the United States. Samples of the glove palm, back and fingers were used as barriers to 0.1 micron fluorescent, polystyrene beads. The rubber was subjected to a stretching protocol designed to mimic actual use conditions.
Results. The likelihood of transmission of particles through the latex rubber samples was dependant upon frequency of stretching, exposure time and condition of the rubber.

GLOVE SAMPLE	% OF SAMPLES SHOWING PARTICLE TRANSMISSION WITH STRETCHING	WITHOUT STRETCHING
Unused (India)	17	4
Used (India)	100	34
Unused (USA)	45	8

Discussion/Conclusions. Re-used surgical rubber gloves are more porous to virus sized particles compared with unused gloves. Anti-microbial contaminants in latex may affect the viability of virus particle transmission.

T.G.P.20

A STUDY ON HIV-1 INFECTION AMONGST HEMOPHILIACS IN IRAN.

Rezvan,Nouri*;Taroyan,S.*;Jalali,S.** and Keyhani,M.**
*Iranian Blood Transfusion Service, Tehran, Iran.
**Iranian Hemophilia Centre, Tehran, Iran.

Objective. An HIV-1 seroprevolence study was conducted on 368 hemophiliacs
found to be the only group exposed to HIV, amongst the high-risk groups
studied in Iran so far.
Methods. HIV-1 antigen and antibodies were tested by Elisa(Recombinant HIV-
1, Envacor and HIV-Antigen, EIA, Abbott Diagnostics, U.S.A.
Enzygnost Anti-HIV-micro, Behring Institute, W.Germany)
Results. 19%(69/368) of the patients studied were found seropositive, i.e.
20%(62/285) Hemophilia A patients, 12%(6/50) Hemophilia B patients and
only 3%(1/33) of patients suffferring from other bleeding disorders such as
von Willebrand, platelet dysfunction and afibrinogenaemia. All the anti-
HIV positive patients were positive for anti-P24 and anti-gp41 and all but
one with full-blown, AIDS were negative for HIV antigen. The anti-HIV
negative hemophiliacs were also tested for HIV antigen for possibility of
recent infection, but none were found positive. The highest incidence of
HIV infection was found in the sexually active group of 20-40 years.
However, no transmission was detected when all family members of 11 anti-
HIV positive patients were examined.
Conclusion. Follow-up studies on hemophiliac patients and screening of thei:
families followed by provision of necessary information and counselling
as well as control of imported clotting factor concentrates would be most
important in the prevention and control of AIDS in Iran.

T.G.P.21

ADAPTING WESTERN EXPERIENTIAL EXERCISES INTO AIDS PREVENTION COUNSELING TRAINING IN DEVELOPING COUNTRIES

JD DUPREE*, A DEMBY**, R CHINGONO***

*AIDSCOM, Washington DC; **Lassa Fever Research Project, Segbwema, Sierra Leone; ***AIDS Programme, Harare, Zimbabwe

Objective. To demonstrate that there are culturally sensitive and effective methods for adapting Western experiential exercises into AIDS prevention counseling training in developing countries.

Methods. This paper confronts some of the Western stereotypes about people from developing countries and their relationship to each other, to disease, death, and needs for support. The authors describe how such experiential exercises as role-playing, imagining one's own death through guided visualization, and discussing safer sex practices such as non-penetration with one another have been adapted into training in developing countries.

Results. Evaluation forms completed by AIDS prevention counseling training participants in developing country contexts indicate that many of the adaptations have been highly effective. Improvements have been made as a result of the evaluations, though there is still much to be learned.

Conclusion. Many of the skills required for an effective AIDS prevention counseler can be enhanced through culturally sensitive adaptation of some of the experiential exercises developed in the West. Other skills, however, require development of culturally-specific in-country methods.

T.G.P.22

Prevention Counselling: Integrating Concepts and Techniques in all AIDS Prevention Strategies.

D. Stone*, N. Kaleaba**, V. Orias***,
*Johns Hopkins University/AIDSCOM, **The Support Organization (TASO) in Uganda, ***Department of Health/Division of Health Manpower Development and Training Service, Republic of the Philippines. U.S.A.

Objective: Sinse counselling is one of the only strategies to support behavior change in HIV prevention, it is imperative that health care providers, educators, and others are provided with training in counselling concepts and techniques. The authors describe various means of incorporating counselling training within cultural settings.

Methods: Using "Train-the Trainer" Modules, health care providers, educators, and volunteers are being trained in basic prevention counselling concepts and techniques. Emphasis is placed on helping providers cope with client feelings raised by HIV infection either real or imagined, as well as on helping providers focus on high risk behavior of their clients.

Results: Although counselling for behavior change is a new concept, techniques are being adapted in various cultures to provide support. By working with governments and non-governmental organizations within each country, people are being trained to provide their clients accurate information on HIV infection, to assess their own risk, and to cope with anxiety and fear.

Conclusion: Whether HIV prevalence is high or low, providing prevention counselling skills to educators, health care providers, or others is essential. Working within local and cultural parameters prevention counselling proves to be a successful method in helping people change high-risk behavior.

T.G.P.23

AID AND ADOLESCENT: A PRELIMENTARY STUDY OF YOUTHS' PERCEPTION OF AID AS A DISEASE: NIGERIA EXPERIENCE

LOLA VIVIAN ADEKUNLE, DR. (MRS.)
UNIVERSITY OF IBADAN, IBADAN, NIGERIA

SUMMARY: Without doubt AID is a serious infection which has been associated with promiscuity and homosexuality. In Nigeria in spite of the mass campaign, the incidence of the disease has been found to be on the increase. Hence, this study is designed to find out the perception of Nigerian Urban youths of the disease, especially those related to health behaviour, in order to know what alternative strategies to employ with regards preventions.
Objective: To identify the perception and attitude of Nigerian youths to AID as a disease.
Methods: A random sample of 100 Nigerian youths were selected from various works of life, representing 60 males and 40 females. Questions related to AID were asked by 2 interviewers.
Results: The result showed that inspite of the heavy campaign on AID, many Nigerian youths still did not regard AID as a serious disease. A large proportion considered it as a capitalist ploy to down grade humanity and to ridicule the people of the 3rd World.

T.G.P.24

HIV/AIDS-RELATED TRAVEL AND MIGRATION RESTRICTIONS

Duckett, Margaret and Orkin, Andrew
McGill Centre for Medicine, Ethics and Law; Montreal, Quebec, Canada.

OBJECTIVE To identify trends in national regulation and/or practice restricting travel and/or migration by those with HIV infection or AIDS.
METHOD A comparative analysis of reports and data from multiple sources including Canadian and international governmental and non-governmental reports and a survey by questionnaire of all foreign representatives in Canada, and a review of applicable international law.
RESULTS While some countries have adopted deliberate policies of non-restriction of visitors and temporary and permanent residents, over 35 others have policies that discriminate against travellers and migrants with HIV infection or AIDS through mandatory HIV screening, exclusion and/or deportation. Examples of extreme responses are the mass deportation of seropositive permanently resident workers, and exclusion of persons found during border searches to be carrying zidovudine (AZT).
CONCLUSION Mobility and travel are affirmed values in international law and practice, although states enjoy the unfettered right to admit and exclude foreign nationals. The World Health Organization has advised that HIV/AIDS-related travel restrictions are "ineffective, impractical and wasteful". A disturbing trend is emerging, however, in which a significant number of countries have applied HIV/AIDS-related travel restrictions. The implications of this trend for social, cultural and economic exchange are profound, and the symbolic effect of such restrictions may impede global efforts to respond effectively to HIV/AIDS.

Épidémiologie : VIH-2
Epidemiology: HIV-2

T.G.P.25

DETECTION OF HIV-2 INFECTION AND RATIO TO HIV-1 AMONG HOSPITALIZED PATIENTS IN RIO DE JANEIRO, BRAZIL

Sion,FS*; Sereno,AB**; Krebs, John W***; Gonçalves,RS*; Quinhoes,EP*; Weniger,BG***; Perez,MA**; Santos,EA*; Ramos Filho,CF**; Valiente,PM**; Ismael,C*; and the Clinical AIDS Study Group. *Hospital Gaffrée e Guinle, Univ do Rio de Janeiro (RJ); **Hospital Universitário, Univ Fed do RJ, Brazil; ***Centers for Disease Control, Atlanta, USA.

Objective. To detect the presence of Human Immunodeficiency Virus Type 2 (HIV-2), and determine its ratio to HIV-1 to establish a baseline in this representative site to monitor the rate of penetration of this new strain of HIV in South America.
Methods. Sera collected 10-12/1988 from all consenting adult patients (n=496) admitted to all medical wards of two teaching hospitals were screened by ELISA assays using whole-virus-lysates of HIV-2 (Genetic Systems Corp[GSC]) and of HIV-1 (GSC). Sera repeatedly reactive (RR) for either virus were tested by the corresponding Western blot (WB) (HIV-2:GSC; HIV-1:Bio-Rad). WBs evidencing all 3 major gene regions (*gag, pol & env*) were considered Positive (P); 2 genes Indeterminate (I); and only 1 Equivocal (E). Specimens for virus isolation and DNA detection are being collected.
Results. Among 496 patients, 5 were RR by ELISA to HIV-2 only, 105 were RR to HIV-1 only, and 27 were RR to antigens of both viruses. Of these RR patients tested by the corresponding WB, 1 (0.2%, 1/496) was P for HIV-2 only (and negative on ELISA for HIV-1), 17% (86/496) were P for HIV-1 only (13 of these were also I or E for HIV-2), and 2% (11/496) P for both HIV-2 and HIV-1. There were another 17 RR patients with I results, and 16 with E results on either WB. Six RR patients were negative on corresponding WB test. Seroprevalence of WB P results only, an underestimate due to exclusion of I's, was 20% (98/496). The patient P for HIV-2 only was a 48yo previously-transfused woman with cough, oral candidiasis, bronchiectasis, and GI strongyloidiasis. The HIV-2:HIV-1 ratio was about 1:100. HIV-2 appears pathogenic. Dual Ps and the Is and Es are challenges to interpretation.

T.G.P.26

PROBLEMATIQUE DE L'INFECTION HIV2: EXEMPLE DU SENEGAL.

M'Boup, Souleymane*, N'Doye, I.*, Samb, A.*, Siby, T.*, Boye, C.B.*, Sangaré, L.* et al.
*Hopital A. Le Dantec, Dakar, Sénégal.

Objectifs. Faire le point des connaissances actuelles sur HIV2 et identifier les problèmes particuliers qui restent posés en Afrique de l'Ouest comparativement aux connaissances actuelles sur HIV1.
Methodes. Depuis la 1^{ere} description en 1985 de HIV2 des travaux ont été réalisés dans les domaines les plus divers (épidémiologie, virologie, clinique etc.) au Sénégal et dans plusieurs pays d'Afrique de l'Ouest. Le bilan de ses études permet de dégager des problèmes spécifiques à l'infection HIV2 comparativement à HIV1.
Resultats. Les enquêtes épidémiologiques menées au Sénégal et dans la plupart des pays d'Afrique de l'Ouest sur des populations adultes saines ont montré une prédominance de l'infection HIV2 sur l'infection HIV1 et sa présence depuis au moins 1976. Des profils sérologiques particuliers ont été rencontrés et de nombreuses souches de virus HIV2 isolées. Des prostituées infectées par HIV2 suivies depuis 3 ans ne montrent pas de signes d'ARC ou de SIDA . L'étude de cas de SIDA HIV2 et HIV1 permet de dégager la longue incubation des pertubations causées par ce second virus. Tous ces résultats permettent de dégager une spécificité de l'infection HIV2.
Conclusion. HIV2 présent surtout en Afrique de l'Ouest, a été particulièrement étudié au Sénégal. Il pose des problèmes spécifiques comparativement à HIV1 et son étude devrait permettre de mieux comprendre l'épidémie actuelle du SIDA et pourrait aider aux mesures de lutte contre celle- ci.

T.G.P.27

HIV-2 LINK TO AIDS

Romieu, Isabelle*; Marlink, R.*; M'Boup,S.**; Kanki,P.J.*; Hernandez M.*; Essex M.*.
*Harvard University, School of Public Health, Boston, MA.
**University of Dakar, Dakar, Senegal.

Objective: To determine the extent of HIV-2 pathogenicity as compared to HIV-1.
Methods: To date, very little is known about the clinical spectrum of HIV-2 infection, and it is still unknown whether HIV-2 will ultimately prove to be as pathogenic as HIV-1. We, therefore, reviewed published laboratory and epidemiological data presently available to analyze the pathogenic potential of HIV-2.
Results: Although it appears that HIV-2 may be associated with AIDS, in vitro laboratory data concerning comparative HIV-2 cytopathogenicity are inconsistent. Most of the epidemiological evidence comes from descriptive data, and does not satisfy basic requirements that define causality. The most significant problems are the lack of control group and the absence of a correct temporal relationship with the exposure to HIV-2 preceding the occurrence of the disease. Methodological issues for further epidemiological studies are discussed.
Conclusion: On the basis of existing data, the pathogenic effect of HIV-2 seems limited as compared to HIV-1. Additional studies, of both laboratory and epidemiologic nature, are needed to further characterize the pathogenic potential for this distinct human retrovirus.

T.G.P.28

DOUBLE HIV1 AND HIV2 SEROPOSITIVITY IN GUINEA

Fouquet-Fretz catherine*; Gluckman J-C*; Fournel J-J*
Kourouma K **; Diallo P**; Diallo K**
*CTS-CHU Pitié-Salpêtrière, Paris, France; **CTS-CHU Conakry, Fria, Guinea.

3855 blood donors ,142 women from maternity and 218 patients (class III - IV) were screened between November 1987 and December 1988 for HIV1 and HIV2 antibodies in three sites in Guinea. Repeatedly reactive sera were confirmed in Paris with the Western blot technique. We attempted to discriminate between HIV1 and HIV2 reactivity in the sera that showed both HIV1 and HIV2 positivity in Western blot, using the new Peptilav 1-2 test (Diagnostic Pasteur) and the screening for anti Nef .

- None of the 142 women were confirmed HIV positive.
- 17 of 3855 donors (0,44%) were confirmed HIV positive : 7 to HIV1, 9 to HIV2 and one to the both viruses. This serum was clearly discriminate as HIV2 with the Peptilav 1-2 test.
- 35 of 218 patients were confirmed HIV positive:17 to HIV1,7 to HIV2 and 11 to both viruses with the Western blot. With Peptilav 1-2 we could discriminate only one of these sera as HIV1. It is also anti Nef positive ; 4 sera gave stronger reactivity to HIV2 ; 3 of them could be screened for anti Nef and were negative; and 6 others showed simultaneous reactions to both virus peptides ; 5 were anti Nef positive and 1 negative. This finding raise the possibility of true double infections or infection with a third new virus whose epitopes are shared by HIV1 and HIV2.

These results indicate the presence of the two viruses in Guinea. The positive donors are predominantly infected with HIV2 (58,8%) and the patients with HIV1 (68,5%). 6 persons had serum reactivity suggesting simultaneous infection by HIV1 and HIV2 viruses or by another closely related virus. Only isolation of the viruses involved will being a conclusion.

T.G.P.29

COINFECTIONS HIV-2/HTLV-1 DANS UN GROUPE DE SUJETS A RISQUE AU SENEGAL.

Ricard, Dominique *; Mboup, S *; Denis F**; Essex, M.***.
*Faculté de Médecine et de pharmacie de Dakar,Sénégal; **Faculté de Médecine de Limoges,France; ***Harvard School of Public Health, Boston,USA.

OBJECTIFS:Apprécier les facteurs de risque HIV-2 et HTLV-1 dans une cohorte.
METHODES: Un groupe de 200 prostituées de Ziguinchor (Sud Sénégal) est suivie de manière prospective depuis 1986. Un interrogatoire, un examen clinique et une prise de sang sont réalisés lors de l'inclusion puis chaque six mois.
RESULTATS: 40 % des sujets de la cohorte sont séropositifs pour HIV-2 (méthode WB), 16 % présentent des anticorps contre HTLV-1 (méthode WB); 78 % des sujets HTLV-1 sont également HIV-2 positifs.Nous avons analysés les facteurs de risque des deux rétrovirus: En ce qui concerne HIV-2 nous avons retrouvé comme facteurs significativement différents entre le groupe des séropositifs et séronégatifs: le tarif demandé au client (p=0,01), l'origine du sujet (sénégal/étranger), le nombre d'épisodes de pertes vaginales (p=0,002) et une sérologie HTLV-1 positive (p=0,0001). Pour HTLV-1: l'âge (p=0,002), les scarifications (p=0,002), les épisodes de pertes vaginales (p=0,01) et une sérologie HIV-2 positive (p=0,0001) ont été retrouvés significatifs.
CONCLUSION: Les coinfections HIV-2/HTLV-1 sont dans notre cohorte fréquentes et présentent des particularités qui seront discutées.

T.G.P.30

THE EPIDEMIOLOGY OF HIV1 AND HIV2 IN THE GAMBIA, WEST AFRICA

Oelman, Bruce*; Wilkins, HA **; Hughes, A***; Whittle H**; Jaiteh,KO*; Cham, MK****.
*Epidemiology and Statistics Unit, Banjul, The Gambia. **Medical Research Council, Fajara, The Gambia. ***Royal Victoria Hospital, Banjul, The Gambia. ****Medical and Health Department, Banjul, The Gambia.

Objective. To estimate the prevalence of HIV infection in The Gambia, West Africa, and to investigate the factors to which this is related.
Method. Samples were obtained from 5569 subjects - 2051 from random cluster samples and the remainder mainly from subjects attending health facilities and readily accessible occupational groups. A risk factor questionnaire was administered to a sample of these subjects. Serology was carried out with ELISA and positive results were confirmed with Western Blot.
Results. 88 subjects (1.6%) had evidence of infection with HIV2 and 6 (0.1%) with HIV1. The overall prevalence of HIV infection did not differ between the main groups studied or between sexes but the prevalence varied with age. HIV2 infections were found in all age groups but the HIV1 infections differed being limited to those under 30 years (p<0.01). The prevalence of HIV2 infection varied significantly with age in males (p<0.001) with a peak in the 35-44 yr. age group (18/477, 3.8%) while in women the peak was in the 25-34 yr. age group (25/1073, 2.3%). Preliminary and univariate analysis of risk factor data shows that infection in males was significantly related to a history of penile ulceration and urethral discharge.
Conclusion. The epidemiology of HIV2 infection in The Gambia has similarities to that of HIV1 infection elsewhere in Africa, however, the spread of HIV1 and HIV2 in the community appears to have been different.

T.G.P.31

NO EVIDENCE OF VERTICAL TRANSMISSION OF HIV-2 IN BISSAU

Poulsen, Anne-Grethe*; Kvinesdal, B.B.*; Aaby, P.**; Frederiksen, K.*; Mølbak, K.*; Dias, F.*** et al.
*Statens Seruminstitut, Copenhagen, Denmark, **University of Copenhagen, Copenhagen, Denmark, ***Laboratorio Nacional de Saúde, Bissau, Guinea-Bissau.

Objective. To evaluate the occurrence of vertical transmission of HIV-2.
Methods. A cross-sectional HIV community study of the inhabitants of 100 randomly selected houses in Bissau, 1987. A case-control study of HIV-2 seropositives and seronegative controls matched for age, sex and civil status, 1988 (mean follow-up time 11 months), including a detailed obstetric history. All bloodsamples tested for antibodies against HIV-1 and HIV-2 in ELISA and Western Blot as appropriate.
Results. Only HIV-2 was found, no case of vertical transmission could be demonstrated; 4 of 680 children 0-14 years were HIV-2 seropositive, 3 had a history of blood transfusion. Fifteen HIV-2 seropositive women had a total of 18 children of 3 years of age or younger, all were HIV-2 seronegative. 1988: 6 HIV-2 seropositive women had given birth to 6 children during follow-up; the three oldest were HIV-2 seronegative, the three youngest seropositive with WB similar to their mothers'. Three months later these 3 children had lost most or all of their antibodies. - Twenty-nine HIV-2 seropositive women and 57 controls were interviewed; no difference was found for live children, dead children or abortions, neither in total numbers nor of the 3 most recent pregnancies.
Conclusion. Vertical transmission of HIV-2 seems to be rare or absent, it could be unnecessary to counsel HIV-2 seropositive women in early pregnancies to get abortions.

T.G.P.32

PREVALENCE AND CORRELATES OF RETROVIRAL INFECTIONS AMONG PROSTITUTES WORKING IN THE GAMBIA

Pepin, Jacques; Egboga A.; Alonso P.; Gaye I.; Whittle H.; Wilkins A et al. The MRC Laboratories, PO Box 273, Banjul, The Gambia.

Objective: To study the prevalence of HIV-1, HIV-2 and HTLV-I infections and their correlates among a high-risk group in The Gambia.
Methods: 267 prostitutes(P) working in 5 urban centers of The Gambia were intèrviewed, examined and bled. Screening for HIV-1 and HIV-2 was done with competitive Elisas and confirmation by WB. HTLV-I antibodies were measured with a particle agglutination test.
Results: 69/264 (26.1%) were HIV + (66 for HIV-2 only, 1 for HIV-1 only, and 2 for both). P working for less than 1 year were less likely to be HIV + (5/42 [11.9%] vs 63/217[29%], p=0.03), but the prevalence of HIV infection was not correlated with duration of prostitution for those working for more than 1 year. HIV + P were older (32.8y vs 28.8y, p=0.02), less expensive (mean price per intercourse: $3.82 vs $4.77, p=0.01), and more likely to have positive RPRs and TPHAs (45/69[65.2%] vs 63/194[32.5%], p<0.001) than HIV - P, but there was no difference in the number of customers per day nor in the frequency of oral contraceptive use. 53/256 (20.7%) were HTLV-I +; HIV + P were more likely to be HTLV-I + (24/68[35.3%] vs 29/188[15.4%], p<0.001) than HIV - P.

Conclusion: HIV-2 has probably been introduced recently in this cohort of prostitutes. Infection with HIV-2 is associated with evidence of infection with T. pallidum and HTLV-I.

Aspects cliniques (partie 1)
Clinical Features (Part 1)

W.G.P.1

HIV,HBV,DELTA-AGENT AND T.PALLIDUM INFECTIONS IN TWO RURAL AFRICAN AREAS.

de Lalla Fausto,Rizzardini G.,Zeli P.L.,Rinaldi E.,Santoro D. and Verga G.
S.Anna Hospital,Como,Italy.

Objective.To compare the seroepidemiology of HIV,HBV,delta agent and T.pallidum infections in two rural populations living in North Uganda (NU) and in Central Burundi (CB).
Methods.Sera collected in March-October 1986 (Kitgum District,NU) and in June-December 1987 (Buteri,CB) were stored at -20°C until tested for HBsAg,HBsAb (RIA methods) and anti-HIV antibodies (ELISA and WB) and screened for syphilis using the T.pallidum haemagglutination (TPHA) test (BBR). Samples showing reactivity against HIV p 24 and gp 41 (or gp 120) in WB were considered as anti-HIV positive. HBsAg-positive sera were also tested for anti-delta antibodies (RIA method).
Results.The 358 sera collected in NU were obtained from 289 outpatients (174 peasants and 115 soldiers) and 69 inpatients (50 TB and 19 clinically suspected of beings AIDS cases). In CB,sera were drawn from 30 healthy people,33 outpatients and 27 inpatients (all with clinical diagnosis of AIDS).All patients (264 males and 184 females) were adult (age range:14-80).In Ugandan people 63.6% of anti-HIV positive and 25.8% of anti-HIV negative patients were found to be TPHA-positive respectively ($p<0.01$).For Buteri the corresponding figures were 21.4% and 1.6% respectively ($p<0.04$).As for full blown AIDS,TPHA-positivity was 62.5% and 25.0% in NU and CB respectively. No association was,on the contrary,found in both areas between either anti-HIV or TPHA positivity and seropositivity for B and delta hepatitis serological markers (p NS).
Conclusion. This study confirms the association between seropositivity for HIV and T.pallidum (TPHA),suggesting common patterns of transmission.It also shows no correlation between either anti-HIV or TPHA positivity and markers for B and delta hepatitis in two rural African areas.

W.G.P.2

MARQUEURS DES RETROVIRUS (HIV ET HTLV-I) ET DU VIRUS DE L'HEPATITE B CHEZ LES LEPREUX AU CONGO.

A.Itoua-N'Gaporo*, E.Sassou-Guesseau*, G.Léonard**, M.Verdier**, M.Mounier**, François Denis**. *Institut supérieur des sciences de la santé, Brazzaville, Congo ; **Département de Virologie CHU Dupuytren, Limoges, France.

Objectif : Déterminer la prévalence des marqueurs HIV, HTLV-I et HBV chez les lépreux et dans des populations témoin au Congo. Comparer les marqueurs HBV en fonction du statut sérologique HIV dans les deux groupes.
Matériel : En 1988 un total de 800 patients : 318 lépreux et 482 témoins ont été soumis à un prélèvement de sérum dans 4 zones du Congo.
Méthodes : Dépistage HIV par ELISA (Abbott recombinant HIV-1 EIA), HTLV-I par immunofluorescence indirecte ; confirmation par Western Blot (Rapid Lav Blot I et II, Diagnostics Pasteur pour HIV ; avec souche HUT 102 pour HTLV-I).
Les marqueurs HBV : Ag HBs, antiHBs, antiHBc, AgHBe, anti-delta par Abbott EIA.
Résultats : Globalement, les prévalences sont respectivement pour les témoins et les lépreux de 3,2% et 3,8% pour HIV, de 1,9% et 9,7% pour HTLV-I et de 9,6% et 7,2% pour l'Ag HBs.
En fonction des zones géographiques, de très fortes variations sont observées allant pour HIV de 4,3% à 8,9% chez les témoins et de 1,3% à 10,2% chez les lépreux. Chez ces malades, la prévalence HTLV-I va de 0,5% à 23,4%.
Les paramètres HBV sont analysés en fonction de la séropositivité HIV et HTLV-I.
Conclusion : Il n'y a pas de différence statistique entre les prévalences HIV chez les lépreux et les témoins, ni entre les formes polaires de lèpre ; il n'existe pas non plus de différence de "profils" sérologiques HBV entre séropositifs et séronégatifs. En revanche, les lépreux sont significativement plus infectés par le HTLV-I que les témoins.

W.G.P.3

A TWO-YEARS EXPERIENCE IN HIV-POSITIVE PATIENTS IN HOSPITAL DE CLINICAS DE PORTO ALEGRE (BRASIL)

Sprinz, Eduardo; Kronfeld, M.; Motta, M.A.
Hospital de Clinicas de Porto Alegre, Rio Grande do Sul, Brasil.
Universidade Federal do Rio Grande do Sul, Brasil.

Objective: Describe Hospital de Clinicas de Porto Alegre (HCPA) experience in HIV-positive patients according to risk groups.
Methods: It was reviewed 185 registers of HIV-positive patients who were at HCPA during January 1986 till December 1988.
Results: There were 173 men and 13 women. Among risk groups: 74 (40%) were homossexuals men; 75(40,0%), bissexuals men; 10 (5,4%), with coagulation disorders; 8 (4,3%), drug addicts; 8 (4,3%), had multiple transfusions; 6 (3,3%), bissexuals and drug addicts; 5(2,7), heterossexuals (4 women and 1 man), all with genital lesions.
Conclusion: As in other countries, the greatest group are the homossexuals and bissexuals men with 80% of the sample. As a whole group, those who received transfusion (Blood disorders and multiple transfusions) have 10% of the sample. Drug addicts, as a risk group are not so numerous as in other countries. Although our sample is not so large, it appears that heterossexual contamination occurs only in individuals with genital lesions.

W.G.P.4

A SURVEY FOR UNRECOGNIZED HIV INFECTION IN A SPECIAL STD CLINIC IN KUWAIT

Alowaish, Rashed*; Behbehani, K.**
*Department of Public Health, Ministry of Public Health, Kuwait.
**Department of Microbiology, Faculty of Medicine, Kuwait University, Kuwait.

A three month survey for the presence of unrecognized HIV was conducted August through October 1988, on a total population of 3123 STD exposed patients and volunteer premarital examinees who presented themselves for standard STD testing. Of this total, 10% were selected (305) for HIV testing by methods of ELISA, and when required, Western Blot. The sample group was classified according to sex, marital status, occupation, age group, nationality (Kuwaiti vs Non-Kuwaiti), and sexual history.
The sample group reported travelling to total of 27 different countries within the previous six months and were queried on their sexual history, including heterosexual/homosexual encounters and premarital/extramarital/ sexual history. Clinical diagnosis was also recorded.
No HIV infection could be determined in the sample, which otherwise would appear to be a group at higher risk. One explanation may be that the group is not characterized by repeated sexual exposure and none were IV drug addicts or users.

W.G.P.5

ABOUT MONITORING OF HIV-SPREAD IN A DEVELOPING COUNTRY

BORNEMANN R *, RICHTER C **, BSCHOR, F *
* Institut fur Rechtsmedizin der Freien Universitat Berlin, Hittorfstr 18, D-1000 Berlin 33
** Diakonissenkrankenhaus, D-2800 Bremen, FEDERAL REPUBLIC OF GERMANY

Objective: To determine the actual AIDS-threat and introduce prevention efforts with the means of a primary health care system.

Methods: Since 1986, HIV-spread was monitored in an African district hospital. HIV-testing was done in patients with possibly HIV-related disease, such as shingles (herpes zoster), therapy-resistant STD's, or sputum-positive TB (precedent monitoring of diseases helped to give early evidence of prevalence-alteration). In the general population, "Risk-groups" were detected, infection-routes were traced.

Results: A rise of shingles and sputum-positive TB was stated in the area. No rise of Malaria e.g. could be found. In young adults with shingles, a high coincidence with HIV-infection was found.

Conclusion: Shingles e.g. - easy to diagnose even by health workers - could become an "indicator disease" for HIV-spread without HIV-testing. This requires a precedent monitoring of such diseases in areas not yet AIDS-affiliated. With such a "basic monitoring", regional HIV-spread could be determined and prevention-efforts could be focused.

W.G.P.6

AIDS ASSOCIATED ENDEMIC INFECTIOUS DISEASES IN MEXICO

Garcia L*, Morales RA*, Palacios M*, Bravo E*, Mora JL*, Valdespino JL*, Sepulveda J*
*Directorate of Epidemiology, Ministry of Health. Mexico

Objective: To define the characteristics, epidemiological distribution and clinical evolution of AIDS associated endemic infections.
Method: Information was taken from registries notified to the General Directorate of Epidemiology between January 1981 and October 1988.
Results: Clinical information was available from 591 patients (87% men and 69% between 25 and 44 years of age). Data on reported diseases at time of initial AIDS diagnosis are: *P. carinii* pneumonia (PCP) 8% (n=50); other infections 76% (n=452); Kaposi's sarcoma (KS) 5% (n=28) and two or more clinical entities 8% (n=49). 882 pathogens were identified in 493 patients. Endemic infections (215, 24%) were: tuberculosis (71,8%), pneumoniae (nsp) (61,7%), cryptosporidiasis (25,3%), amebiasis (17,2%), salmonellosis (11,1%), toxoplasmosis (11,1%), cryptococcosis (10,1%) histoplasmosis (6,1%), giardiasis (3,0.3%). Patogens identified once were *T. trichiura, I. belli, T. cruzi, C.immitis, A.lumbricoides, P. malariae.* Enteropathogens represented 7% of all infections. Chronological, regional, transmission categories, and prognostic differences were observed between patients presenting endemic infections and the rest.
Conclusion: Endemic infections are associated with an increasing number of AIDS patients as the epidemic expands to rural areas, to heterosexuals and to lower socioeconomic levels. Prophylaxis and treatment probabilities should be explored.

W.G.P.7

THE IMPACT OF HIV INFECTION ON CHILD SURVIVAL IN AFRICA

Valleroy, Linda A.*,**; Harris, J.R.* and Way, P.O.**.
*U.S. Agency for International Development, Washington, DC, USA, ** U.S. Bureau of the Census, Washington, DC, USA.

Objective. To estimate infant HIV infection prevalence and infant mortality rates associated with the vertical transmission of HIV, and to compare these figures with estimates of overall infant mortality and child survival rates. Methods. HIV seroprevalence data from pregnant women living in 12 countries in East, Central, and West Africa are used to estimate HIV infection prevalence and HIV-attributable mortality rates in infants, assuming: 25-60% vertical HIV transmission; and infant mortality of 20-25% among infected offspring. Estimates are compared with U.N. overall infant mortality rates. Results. The results for East African capital cities are:

City	HIV Prevalence in Infants	HIV-Attributable Infant Mort. Rate	Overall Infant Mortality Rate
Nairobi	0.6-1.6 %	1-4 /1000	72 /1000
Lilongwe	2.4-5.7	5-14	150
Maputo	0.3-0.6	1-2	141
Dar Es Salaam	0.9-2.2	2-5	106
Kampala	6.0-14.5	12-36	103

The estimated infection prevalence in infants in Central and West Africa ranges from 0.1-11%; the HIV-attributable infant mortality rates from <1-27. Conclusion. These estimates show that maternally-transmitted infection is having a low impact on overall infant mortality in some areas but a major impact in others. However, the later mortality of HIV-infected children who survive infancy may have a substantial impact on child survival rates.

W.G.P.8

THE NATURAL HISTORY OF HIV INFECTION IN TWIN PAIRS BORN TO HIV+ WOMEN IN KINSHASA, ZAIRE.

Hassig, Susan E.*/**; Nsa, W.*; Menzila, T.*; Kashamuka, M.*; Ryder, R.*/***. *Projet SIDA, Kinshasa Zaire; **Tulane University, New Orleans, USA; ***CDC, AIDS Program, Atlanta, GA.U.S.A.

Objectives. To describe the clinical and serologic progression in pairs of twins born to HIV+ women.
Methods. Nine "case" twin pairs born to HIV+ women and 10 "control" pairs born to HIV- women have been followed for the 18 month post-partum period. Blood drawn at 12 and 18 months was tested for HIV. All episodes of illness through age 18 months were recorded.
Results. Five case and 9 control pairs survived the first month of life.

Case pairs	HIV Serology at 12 + 18 mos. (Twin 1/Twin 2)	Clinical AIDS (Twin 1/Twin 2)
Pair 1	Pos/Neg	Yes/No
Pair 2	Pos/N/A (Dead)	No/Yes
Pair 3	Neg/Neg	Yes/No
Pair 4	Neg/Neg	No/No
Pair 5	Neg/Neg	No/No

Chorioamnionitis was diagnosed in the placenta from the dizygotic Pair 1. In addition, Twin 1 was breastfed while Twin 2 refused all maternal milk.
Conclusions. The discordant serologic and clinical pictures seen in these twin pairs emphasizes that even with equivalent exposure, environment and genetics, variations in HIV natural history can and do occur.

W.G.P.9

CORRELATION OF HYPERGAMMAGLOBULINEMIA WITH ASYMPTOMATIC AND SYMPTOMATIC HIV INFECTION IN A COHORT OF AFRICAN INFANTS

Margaret J. Oxtoby, R. Ryder, W. Nsa, T. Manzila, S. Hassig, F. Behets, C. Brown. Projet SIDA, Kinshasa, Zaire; Centers for Disease Control, Atlanta, Georgia, USA.

Objectives. To examine the relationship between hypergammaglobulinemia and HIV infection in a large prospective cohort of African children. Methods. 473 children born to HIV-infected women and 597 children born to age- and parity-matched uninfected women have been followed prospectively since birth. Quantitative immunoglobulins (mg/dl, nephelometric assay) at 9 months age are being compared with serologic and clinical markers of HIV. Results. Using persistent HIV antibody (beyond 12 months) as laboratory evidence of HIV infection, and 3 clinical signs by the WHO criteria as suggestive of symptomatic infection, mean immunoglobulin levels are shown.

	N	IgG	IgM	IgA
Symptomatic, persistently HIV ab+	12	2732	236	100
Asymptomatic, persistently HIV ab+	28	1939	163	76
Symptomatic, HIV ab-, mother HIV+	4	1372	112	51
Symptomatic, HIV ab-, mother HIV-	8	1120	157	78
Asymptomatic, HIV ab-, mother HIV+	157	1056	128	66
Asymptomatic, HIV ab-, mother HIV-	224	1028	120	62

Of children born to HIV- mothers (many ill with other infections or malnourished), 17% had total Ig>1500; of children born to HIV+ mothers, 20% of uninfected children and 90% of infected children had total Ig>1500. Conclusion. High Igs were a sensitive marker of HIV infection even before symptom onset, and were uncommon in children ill with other infections.

W.G.P.10

INFECTION PAR HIV1 DANS LES 5 MATERNITES DE BRAZZAVILLE (R.P.CONGO) : FACTEURS DE RISQUE MATERNEL ET CARACTERISTIQUES DES NOUVEAU-NES

Marc Lallemant*, S. Lallemant-Le Coeur**, G. Jourdain*, P. Mpelé***, C. Rouzioux****, B. Larouzé** et al. * ORSTOM, Brazzaville/Paris,**INSERM U13, Paris,***Programme National de Lutte contre le SIDA, Brazzaville,****Laboratoire de virologie, Hopital Necker, Paris. FRANCE

Objectif : Identifier, dans un échantillon représentatif de parturientes les facteurs de risque de l'infection maternelle. Etudier les conséquences de cette infection pour le nouveau né.
Méthodes : De façon séquentielle, du 20/7 au 20/8/1988, 1406 parturientes ont été recrutées et testées pour anti-HIV1 (dépistage par test rapide/Organics ; vérification de la positivité en ELISA/Pasteur et confirmation en Western Blot/Dupont de Nemours).
Résultats : La prévalence de la séropositivité était de 3.0% (43/1406). Les risques relatifs (RR, I.C. à 95%) associés à la séropositivité ont été calculés pour chacune des caractéristiques maternelles :

Age	<21 ans	21-30ans	>30 ans		Quartiers	Périph.	Centre	
prévalence HIV	1.3%	4.6%	1.6%	p<.01		2.0%	6.0%	p<.01
RR (I.C. 95%)	1	3.6 (1.5-8.6)	1.3 (0.3-4.7)			1	2.3 (1.3-4.1)	
Hospitalisations>1980		non	oui		N° Unions	1	>1	
prévalence HIV		2.3%	6.9%	p<.001		2,1%	5,7%	p<.001
RR (I.C.95%)		1	3.0 (1.6-5.6)			1	2,7 (1.5-4.8)	

Les mères ne différaient pas pour les autres caractéristiques telles que le statut matrimonial, l'activité, ni, après ajustement sur l'age, pour leur histoire génésique. Les techniques d'analyse multivariée n'ont pas permis de prédire de façon satisfaisante leur statut HIV. Les enfants nés de mère respectivement anti-HIV1+ et anti-HIV1- ne différaient pas quant à la mortinatalité, au sex-ratio et au poids de naissance.
Conclusion : Le fait que l'infection HIV1 prédomine encore dans les quartiers centraux et dans certaines tranches d'age, invite à poursuivre la prévention à l'échelle de la population dans son ensemble (risques nosocomial et sexuel) Toutefois, les caractéristiques des mères ne permettent pas de prédire leur statut sérologique et donc de cibler des actions de prévention à l'échelon individuel (dépistage notamment).

W.G.P.11

UPDATE ON THE TRANSITION FROM HOMOSEXUAL TO HETEROSEXUAL AIDS IN TRINIDAD AND TOBAGO

Farley Cleghorn**, K. Battoo**, C. Diaz**, M. Francis**, B. Hull**, C. Bartholomew*.
* The University of the West Indies, Port of Spain, Trinidad
** The Caribbean Epidemiology Centre, Port of Spain, Trinidad

Trinidad and Tobago (pop 1.2 million) reported 389 cases of AIDS up to December 31, 1988 (32 cases per 100,000). The first case was recognised in 1983 and all 27 cases in 1983-84 were in homosexual/bisexual men. In 1985 there were 5 cases of heterosexual AIDS and 33 cases in homosexual/bisexuals. However, while there was only a 2 fold increase in homosexual/bisexual cases over the following three years, to 61 cases in 1988, there was a 12 fold increase to 66 cases among heterosexual AIDS cases and in 1988 there were more heterosexual than homosexual/bisexual cases of AIDS (66 vs 61). Notably, there has been a rapid increase of AIDS among women so that while in 1985 there were only 4 cases there was a 10 fold increase to 42 cases in 1988 during which interval there was only a 3 fold increase among men (36 vs 106). In 1985/86 all the cases of AIDS in women were infected by bisexual men. Intravenous drug abuse is not practised in Trinidad and Tobago and transfusion associated AIDS accounted for only 7 cases (1.8%). On the other hand, 36% of the homosexual/bisexual cases were in bisexual men.

Trinidad, therefore, serves as a model of the potential for transition from homosexual/bisexual to heterosexual AIDS, initially through bisexual activity and without the added risk factor of IV drug abuse.

W.G.P.12

CLINICAL MANIFESTATIONS OF AIDS IN QUITO, ECUADOR

Ringenberg, Roy*; Sempértegui, R*and Moreno, J**. *Ministry of Public Health, Quito, Ecuador, **Catholic Univ., Cuenca, Ecuador

Objective. To evaluate the clinical manifestations of AIDS in Quito, Ecuador, in order to plan appropriate management of further AIDS patients, and add further information to the global picture of AIDS.
Methods. Review clinical data of all AIDS patients in Quito until June, 88, via chart review and personal contacts with patients and their physicians.
Results. As of June, 1988, only 10 patients had presented with clinical criteria for AIDS in Quito, (pop.:approx 1 million). (By Jan.30,1989 there were 20 AIDS cases in Quito, 40 in Guayaquil (pop.:approx. 2 million)and a total of 61 in Ecuador (pop.:approx.10 million)). The 10 AIDS patients were young (20-40 yrs. 90%), male (80%) Ecuadorian citizens (80%) infected via homosexual (40%) or heterosexual (30%) contact, IV drug abuse (20%), or blood transfusions (10%). They were infected in the US (90%) or Germany (10%). "SLIM DISEASE" (wasting caused by HIV) was present in 90%., with the wasting accompanied by chronic diarrhea in 70%, and by chronic fever and debility in 20%. Pulmonary disease was less frequent (40%), with no known cases of *P. carinii* pneumonia, but with one death due to untreated pneumonia. Other problems included skin disease (60%), hepatobiliary disease (60%), *Candida* esophagitis (40%) and neurological manifestations (40%). Mean time from first symptoms to death in 7 patients was 8 months; 2 AIDS patients are living 12 and 21 months after first symptoms of AIDS; with the 10th lost to follow-up.
Conclusion. "SLIM DISEASE" (wasting due to HIV) is an extremely common, rapidly fatal manifestation of AIDS in Quito, Ecuador. Other common diseases in AIDS are also present, but with very little *P.carinii* pneumonia.

W.G.P.13 A MODEL FOR AIDS OUTPATIENT CARE

Loures, L.*; Rodrigues, L.*; Pinto, W.**; Cardo, D***; Greco, D****; Rangel, F***** et al.
*Ministry of Health, National Division of STD/AIDS, Brasília, Brazil, **State Secretary of Health, São Paulo, São Paulo, Brazil, ***City Secretary of Health, São Paulo, São Paulo, Brazil, ****Federal University, Belo Horizonte, Minas Gerais, Brazil, *****State Secretary of Health, Recife, Pernambuco, Brazil.

Objective. To present a model for AIDS patient care in implementation in Brazil.
Methods. It was carried out: (1) A qualitative and quantitative analysis of the AIDS demand for medical care, including the direct cost of hospitalization. (2) A nationwide analysis of the health care delivery system. (3) Proposal, implementation and evaluation of alternatives to reduce the economic and humanistic impact of the AIDS pandemic in Brazil.
Results. In December, 1988 there were 2,500 AIDS cases in Brazil, seeking for medical care, generating a demand for approximately 1,000 beds, which need to be expanded to 5,000, by 1990. The cost of a bed per day is high, around US$ 25,000 per patient/year. In addition secondary effects of AIDS can include the deviation of medical attention from other serious diseases, and the increase of the rate of endemic diseases, such as tuberculosis. The growing demand of AIDS cases and the impossibility of expanding the number of inpatient services as fast the pandemic, make AIDS a potential threat to the integrity of the health care system.
The model in implementation has two main strategies: preference for outpatient management using the whole health facilities and a wide health care workers training program. One of the objectives of such program is the suppression of professional rejection to AIDS patients. Highly efficient outpatient clinics are the critical point in the model, being reference to the health network. The high efficiency of these units is determined by the multidisciplinary team, by the availability of more complex diagnosis procedures, such as endoscopy and surgical biopsy and specially by the adoption of the day-hospital. The day-hospital, by which the patient returns to the community at night, can be used for intravenous chemotherapy, blood transfusions, hidratation and observation after invasive procedures. Another aspect which garantee the level of efficiency of these units is the free availability of drugs most prescribed. At the same time, alternative services (hospices, home care) has to be established with strong participation of the community. Preliminary evaluation has demonstrated that the model may reduce hospitalization.
Conclusion. This model may reduce the projected number of hospitalization, improve the quality of life of AIDS patients and decrease the cost. It should be implemented in developing countries.

W.G.P.15 Evaluation of HIV antibody tests in Brazil

Ivo-dos-Santos, J.; Campos, D.L.; Couto-Fernandez, J.C.; Passos, S.M.; Dias-Carneiro, L.A. and Galvão-Castro, B.
Department of Immunology, Oswaldo Cruz Foundation, Ministry of Health, WHO Collaborating Centre, Rio de Janeiro, Rio de Janeiro, Brazil.

Objective: To compare the sensitivity, specificity and ease of performance of different serologic tests for HIV in panels of sera from Brazilians.
Methods: Brazilian serum panels (2 panels containing around 300 sera, half of each being HIV positive sera) were tested with the following kits: enzyme immunoassay (EIA): Abbott, Roche, Hoechst, Virgo, Organon and Salck; Virgo indirect immunofluorescence (IIF); Salck Passive Hemmaglutination (PH); Embrabio dot blot (DB) and Karpas cell test (CT). The parameters evaluated were the sensitivity, specificity, time consumed, equipments necessary and serum dilutions.
Results: ≥ 98% sensitivity: Abbott, Roche, Hoechst, Virgo EIA, Organon, Salck EIA, Virgo IIF and Embrabio DB; ≥ 95% specificity: Abbott, Hoechst, Virgo EIA, Organon, Salck EIA, Virgo IIF and Embrabio DB; <150 minutes consumed: Abbott, Virgo EIA, Organon, Hoechst, Virgo EIA, Salck PH and Karpas CT; 2 equipments: Salck PH, Karpas CT and Embrabio CT; undiluted serum: Hoechst.
Conclusions: Although several kits presented the sensitivity and specificity required by the Brazilian Ministry of Health, we think that to obtain a more accurate screening of blood it is necessary to perform lot-to-lot and proficiency evaluations. Evaluation of kits using panels constituted by endemic disease sera (Chagas' disease, schistosomiasis, leishmaniasis and malaria) are underway.

W.G.P.14 THEORY AND METHOD TO DEVELOP A REVISED CASE DEFINITION OF AIDS FROM EMPIRICAL CLINICAL DATA

Perez, MA*; Ismael, C**; Quinhoes, EP**; Ramos Filho, CF*; Weniger, Bruce G.***; Loures, LA****; Martins, PSV*; Krebs, JW***; and the Clinical AIDS Study Group.
*Hosp Universitário, Univ Fed do Rio de Janeiro (RJ); **Hosp Gaffrée e Guinle, Univ do RJ; ***Centers for Disease Control, Atlanta, USA; Ministry of Health, Brazil.

Objective. To review theoretical issues about defining and diagnosing AIDS, and to use discriminant analysis to revise clinical criteria for AIDS surveillance case definitions.
Methods. Seventy-nine variables associated with HIV positivity from a study of 110 HIV+ and 135 HIV- non-surgical hospital inpatients in Brazil (vide Soares, AB, *et al*) were applied on repeated iterations of STEPDISC (SAS, Inc.) to identify the 17 best. The SAS DISCRIM procedure was then applied on a random subset of the cases (n=137), producing the following discriminant score function (for convenience, constant and coefficients multiplied by +100 and rounded to nearest integer; coefficients of 0 eliminated; variable pos=1, neg=0):
SCORE = -84 +100(oralcand) +30(diarr>1mon) +29(anyTB) +20(anyVDnotHerp) +20(splenmeg) +16(fever) +15(convulsions) +11(dermatitis) +7(slowfingertaps) +6(MD-Dx'dZoster) +5(intinfilts) +1(neurvom) -35(oralulc>1mon) -7(anyCAnotlymph) -3(cottwool)
Patients with scores more positive than the cutoff of -9 are predicted HIV+. External validation against the other group of cases (n=108) not used to derive the function found the sensitivity of the prediction to be 92% and the specificity 91%.
Conclusions. The 92% sensitivity of this discriminant function in predicting HIV+'s improves on existing case definitions whose sensitivities range from 50 to 59% (vide Rodrigues, LGM, *et al*). Specificity is only about 8% lower than those other definitions. This data will be useful in developing diagnostic algorithms for diagnosing AIDS which add clinical criteria to the existing pathologic and serologic ones.

Facteurs de risque liés aux MTS (partie 1)
STD Risk Factors (Part 1)

W.G.P.16 PREVALENCE OF HIV SEROPOSITIVITY AMONG STD PATIENTS IN FREETOWN - SIERRA LEONE

Andrew, Kosia; Kargbo, T.; Thorlie, I.; Mansaray, N.; Makiu, E.; Kanu, J.;
Virus Reference Laboratory and STD Clinic, Connaught Hospital, Freetown, Sierra Leone.

Objective. To determine the prevalence and possible inter relationship between HIV seropositivity and various other established STDS'.
Method. 332 patients attending the national referral STD clinic at Connaught Hospital, Freetown, the capital, were chosen by simple random sampling method and investigated for HIV antibodies during the period January - August 1988. Sera from these individuals were investigated by ELISA and twice positive specimens were confirmed by Western Blot Assay. Other STDs were diagnosed in the same clinic through urine, blood, urethral/cervical swabs, excudates from genital ulcerations examinations.
Results. 15/332, (4.5%) were seropositive, of which HIV1 7/15, (46.6%), HIV2, 6/15, (40%), HIV1 & 2 combination 2/15, (13.3%). The distribution of HIV seropositivity in various STDs are: Syphilis 6, LGV 2, Herpes progenitalis 1, Gonorrhoea 4, Candidiasis 1, and Trichomoniasis 1.
Conclusion. STDs, particularly genital ulcerative diseases(GUD) are common in Sierra Leone and may contribute to the increase risk of HIV among Heterosexuals.

W.G.P.17 TARGETING TRAVELLERS FOR AIDS PREVENTION EDUCATION

Pela, Ona A., University of Medicine & Dentistry of New Jersey-School of Osteopathic Medicine, Camden, NJ. U.S.A

Objective: This paper demonstrate the need to target transoceanic travellers for AIDS education with innovative strategies. There is overwhelming evidence that the primary mode of spreading the AIDS virus is through sexual activities. As a result, educational efforts have focused on changing sexual behaviors. Most programs seem to target "gay men", adolescents and ethnic minorities. However,the ease of air travel has shrunk the world into a complex "GLOBAL VILLAGE". It is the concept of the global village that bridges the continents. Using the global distribution of cases and the continued spread of AIDS around urban epicenters as background, this paper focus on travellers as a group that may be grossly under targeted for AIDS education. The author suggest that the AIDS information handout for travellers is not meeting the needs of a global strategy for AIDS prevention. In its place, we suggest that airlines should be encouraged to air 1-2 minutes safety programs on AIDS. The other arm of the proposal is to encourage airports to carry billboards with AIDS relevant messages.

W.G.P.18 HIV INFECTION IN HETEROSEXUALS FROM BUENOS AIRES CITY CONSULTING FOR VENEREAL DISEASE.

Bosaca, Martha*; Belli, L**; Casco, R**; Calello, M*; Gómez Carrillo, M*; Libonatti, O*; Weissenbacher, M*.
*Department of Microbiology, School of Medicine; **STD Section, University Hospital, Argentina.

Objective. To determine the prevalence of HIV antibodies among heterosexuals consulting for a sexually transmitted disease (STD) without suspecting HIV infection.
Methods. Among sexually active heterosexuals consulting for a STD between April 1987 - December 1988, a group of 216 males (median age 22) and 109 females (median age 27) agree to participate in this study. HIV antibodies were screened by EIA and gelatine particle agglutination and confirmed by Western blot.
Results. Table shows prevalence of HIV antibodies in heterosexuals according to drug addiction (DA).

DA	Males		Females		Total	
	No	%	No	%	No	%
IVDA	20/27	74.1	3/9	33.3	23/36	63.9
Non-addicts or non-IV DA	19/189	10.1	3/100	3.0	22/289	7.6
TOTAL	39/216	18.1	6/109	5.5	45/325	13.8

In 13.8% of heterosexuals HIV antibodies were detected, 51% of which were IVDA. Among non-addicts or non-IV DA, 11% were drug abusers but not by IV route, 17% were promiscuous and 30% had more than one STD. Promiscuity and multiple STD appeared equally distributed between HIV-infected and non-infected heterosexuals.
Conclusion. The 13.8% HIV prevalence found among sexually active heterosexuals consulting for a STD but not for HIV, suggests that HIV incidence in the population of Buenos Aires City might be higher than expected.

W.G.P.19 CASE CONTROL STUDY OF HIV POSITIVITY AMONG MALE INTRAVENOUS DRUG ADDICTS (IVDA) IN BANGKOK.

S.Vanichseni*,__H.Wright__**,P.Akarasevi**,W.Pokapanichvong***,D.Taylor****,K.Choopanya*,*Bangkok Metropolitan Administration,**Div.Epid.,Min.Pub.Hlth.,***Prog.Approp.Tech.Hlth.,****Armed Forces Res.Inst.Med.,Thailand.

__Objective__. To determine risk factors for HIV infection in an explosive epidemic among Bangkok IVDA.
__Methods__. In July 1988,452 male IVDA registered at 6 detoxification clinics consented to be interviewed and give a blood sample.
__Results__. 43% were HIV+.Compared to HIV- controls,no relationship was found with age,marital status,recent tatooing or blood transfusion,history of STD or other sexual variables.Associated with HIV+ status were 1.Injecting in company with others,OR 1.9(95CL 1.1-3.2),2.Sharing injection equipment,OR 2.6(1.5-4.4),3.Sharing same "load",OR 3.2(1.7-6.0),4.Injecting at seller's house,OR 1.5 (1.0-2.3),and 5.Time in jail,OR 1.5(1.0-2.2).Only 2.and 3.remained significant after multivariate analysis.Compared to non-sharing IVDA(18% of subjects),those with characteristics 2.through 5.had a cumulative OR of 14.9.
__Conclusion__. Widespread "works" sharing behavior led to an increase in HIV+ prevalence among Bangkok's IVDA from less than 1% in December 1987 to 16% in February,and 44% in September 1988.An intervention effort to change drug use behavior is underway.

W.G.P.20 SEXUAL BEHAVIOR AND PERCEIVED RISK FOR AIDS AMONG BANK EMPLOYEES AND SPOUSES IN KINSHASA

__Moore, Melinda__ *,**, Doppagne A ***, Hassig SE *,**, Piripiri L *, Bertrand WE *,**, Kashala TD *
* Zaire School of Public Health, Kinshasa,Zaire, ** Tulane SPHTM, New Orleans,USA, *** Banq Comm Zaire,Kinshasa,Zaire

__Objective.__ To determine the perceived risk for AIDS and its association with sexual behavior in a selected population.
__Methods.__ 2516 bank employees and spouses were interviewed between 11/87 and 3/88 as part of an annual medical exam.
__Results.__ The perceived risk for AIDS was "very high" or "high" for 30%, "low" for 25% and "nil" for 46%. Those considering themselves at very high or high risk were polygamous, separated or divorced (p=.0081); from Equateur or Shaba Region (p=.00004); knew someone with AIDS (p=.0018); and did not consider AIDS preventable (p=.0007). Married persons with extra-marital contacts (EMC) considered themselves at higher risk for AIDS ($p<10^{-4}$) and were more likely to have changed sexual behavior because of AIDS ($p<10^{-4}$).
__Conclusions.__ One-third of this population considers itself to be at high risk for AIDS. Those who are best educated are most likely to have EMC and least likely to consider themselves at risk. Further education is necessary to reverse pessimism, promote realistic perceptions and encourage further positive behavior changes in this population.

W.G.P.21 ANTI-HIV ANTIBODIES IN MALE AND FEMALE STREETWALKERS IN BUENOS AIRES CITY.

__Multare, Salvador*__; Zarate, M*; Bossaca, M*; Martinez Peralta, L**; Weissenbacher, M**.
*Muñiz Hospital; **Department of Microbiology, School of Medicine, Buenos Aires. Argentina.

__Objective__. To determine the prevalence of HIV infection among prostitutes in Buenos Aires City.
__Methods__. A group of 199 male and female prostitutes were serologically screened between September 14 - November 3, 1988 for HIV, and T. pallidum infection. Prostitution is not legal in Buenos Aires City. The population studied was overnight in jail because of their activities as streetwalkers in Buenos Aires City. They were invited to participate in this study on the understanding that their identity would remaing anonymous and the results obtained would be personally and voluntarily collected. Written informed consent was obtained from each participant. Anti-HIV antibodies were screened by EIA and gelatine particle agglutination and confirmed by IF and Western blot. VDRL and microagglutination tests were used for syphilis serology.
__Results__. The group consisted of 172 female prostitutes ranging in age from 18 to 72 (median 28 years) and 27 male prostitutes ranging in age from 18 to 37 (median 20 years). Total seroprevalence for HIV was 9.5% (5.8% for females and 33.3% for males). 23.9% of 188 prostitutes tested were seropositive for T. pallidum (21% females and 42% males). T. pallidum seropositivity was equally distributed between HIV positive and negative. Of the population studied 4.5% related a history of IVDA. 21% of the HIV-positive and 3% of the HIV-negative streetwalkers were IVDA. At the time of writing only 15% of the group went to the Hospital to pick up the results.
__Conclusion__. In Buenos Aires City a prevalence of 33% for HIV and 42% for syphilis was found among male streetwalkers. For female streetwalkers the prevalence was about 6% for HIV and 21% for syphilis. The female prostitute is an important group to study for better understanding of the heterosexual spread of HIV in Buenos Aires City.

W.G.P.22 COMPARISON OF NEW HIV-2 VIRAL ISOLATES BY SOUTHERN BLOT AND PCR

__Korber, Bette*__; Kanki, P.*; Barin, F.**; M'Boup, S.***; Essex, M.* *Harvard School of Public Health, Boston, MA, **University of Tours, Tours, France, ***University of Dakar, Dakar, Senegal.

__Objective.__ To isolate HIV-2 viruses from individuals of varying health status, and determine their heterogeneity.
__Methods.__ PBLs from seropositive individuals were cocultivated with PBLs from noninfected donors, and transferred to a variety of cell lines including HUT-78, SUP-T1 and U937. Infected-cell DNA was isolated and used as a template for PCR or for Southern blot analysis with an HIV-2 env-region probe. DNA was isolated simultaneously from HIV-2 (NIH-Z) and HIV-2 (SBL-6669) infected lines, and used for reference. Four HIV-2 specific PCR primers and probe sets were used. These were chosen on the basis of being conserved in available HIV-2 sequences, and not being present in HIV-1.
__Results.__ Virus was isolated from four different individuals:

__Isolate__	__Country of Origin__	__Sex__	__Health Status__
AS	Guinea-Bissau	F	Healthy
TY	Portugal	F	Sick, now recovered
MS	Ivory Coast	M	Died of AIDS
LP	Cape Verde	M	AIDS

All four isolates have unique restriction enzyme patterns. When isolates where analyzed in more than one cell line, some variation in restriction pattern was observed. All four HIV-2 specific primer-pairs PCR amplified DNA from TY, MS, LP, NIH-Z, and SBL-6669. AS served as a template for only three out of the four primer-pairs. The HIV-2-specific PCR reagents developed here will be useful for confirmation of HIV-2 infection in individuals with ambiguous serological profiles.

W.G.P.23 TENDENCY OF ANTI HIV ANTIBODIES IN MASCULINE HOMOSEXUALS DURING THE LAST FIVE YEARS IN GUADALAJARA, JALISCO.

__Vázquez-Valls, E__*; Torres-Mendoza, B.* and Jauregui-Rios, M.*
*Instituto de Patología Infecciosa y Experimental "Dr. Fco. Ruiz Sánchez" de la Universidad de Guadalajara, Guadalajara, Jalisco, México.

__Objective__. To evaluate the prevalence of anti HIV antibodies among male homosexuals of Guadalajara during the last five years.
__Methods__. Five samples chosen by the snowball technique from the male homosexual population, as follows: during 1984 (n=23), 1985 (n=268), 1986 (n=226), 1987 (n=238) and 1988 (n=325); determination of anti HIV antibodies were ascertained by the ELISA assay and confirmed by IF and/or WB.
__Results__. The seroprevalence obtained was as follows:

	1984		1985		1986		1987		1988		TOTAL	
	n	%	n	%	n	%	n	%	n	%	n	%
POSITIVES	4	17.3	62	23.1	65	28.7	72	30.2	97	29.8	300	27.8
NEGATIVES	19	82.7	206	76.9	161	71.3	166	69.8	228	70.2	780	72.2
TOTAL	23	100.0	268	100.0	226	100.0	238	100.0	325	100.00	1080	100.0

The range of age of the sample were from 14 to 55 years with an average of 30.2. Of the total 27.8% were positive, making an average of 25.8% of the sample analized. There were no differences between the results of the confirmatory and screen tests used in this study.
__Conclusion.__ The number of cases in the homosexual population are apparently stable and probably this is the beginning of their decrease, and the increase of the casuistic in the heterosexual and pediatric group, as observed in the rest of the world.

W.G.P.24 HIV TRANSMISSION AMONG HETEROSEXUAL COUPLES IN MEXICO

__Sepulveda, Jaime__*; Carlos Avila*; E. Dickenson*; M. Hernandez*
P.J. Kanki**; A. Mazar*
*Directorate of Epidemiology, Ministry of Health, Mexico DF, Mexico.
**Harvard University, Boston, MA, U.S.A.

__Significance:__ The AIDS epidemic in Mexico has shown an increase in heterosexual transmission from a level of 2% at the beginning of 1987 from 2% at the end of 1988.
__Objective:__ To investigate sexual practices, condom use and social characteristics associated with HIV transmission among heterosexuals.
__Methods:__ The study was conducted among a heterosexual population of 58 HIV-seropositive blood donors who were infected in 1986. Twenty-three couples with the husband found positive at donation were identified. The women had no risk factors other than sexual contact with their husbands. The information was collected and analyzed retrospectively in a case-control design.
__Results:__ There were 7/23 (30%) female partners who were seropositive at the beginning of the study. The average age and education were 30 and 4 years, respectively. The retrospective information showed the following:

__Characteristics of women__

	__HIV+ (n = 7)__	__HIV - (n = 16)__
Housewife	85.7%	81.2%
Married	14.2	50.0
> 5 years with spouse	57.1	56.2
Pregnant	28.5	12.5
Practice anal intercourse	14.2	12.5
Use condoms	0.0	18.7
STDs Hx	28.6	12.5

Unprotected vaginal sexual intercourse per week was associated with HIV infection (X^2 for trend = 8.9; p value < 0.05). Seroconversion occurred among five women retested 12 months later.
__Conclusion:__ The increase in heterosexual transmission could be attributed mainly to the frequency of unsafe sexual contact, and low adherence to condom use. This study emphasizes the necessity for increasing educational programs focused specifically on condom use among the heterosexual population.

Epidemiology

W.G.P.25 MALE BISEXUALITY AND AIDS. PRESENT STATUS AND PERSPECTIVES IN MEXICO

Garcia ML*, Izazola JA*, Valdespino JL*, Magis C*, Ornelas G*, Uribe P*, Sepulveda J*
* Directorate of Epidemiology, Ministry of Health, Mexico

Objective. To define the sociodemographic profile, sexual practices and HIV infection prevalence in bisexual men who attend an HIV detection center in Mexico City.
Method. A survey which included HIV test was done in 1676 homosexual and bisexual men, who attended an HIV detection center in Mexico City from January to December, 1988.
Results. 740 men, (44%) declared having had sexual relations exclusively with men (H), 945 (56%) with men and women (B); 643 (87%) of homosexual men had at least one sexual partner during the last 6 months (Ha), 813 (86%) of bisexual men had at least one sexual partner during the last 6 months (Ba), of these, 373 (46%) had only male sexual partners during the last six months (Bam), 115 (14%) had only female sexual partners during the last 6 months (Baf) and 325 (40%) had both male and female sexual partners during the last 6 months (Baml). The HIV prevalence was as follows: H: 35%; B: 28%; Ha 34%; Ba 27%; Hna 43%; Bna 38%; Bam 31%; Baml 23%; Baf 21%. 88% of seropositive subjects were in clinical stage II, 12% were in III, none in IV. B had fewer school years, belonged to lower socioeconomic levels,15% had children. Frequency of stable heterosexual partner was 8% (Bam) to 47% (Baf), anal coitus with women was most frequent in Baml (43%). STD were most frequent in Ha (66%), and Ba (68%). Passive anal coitus (OR:1.5-6.1), rectal douches (OR:1.7-6.2), STD (OR:1.0-1.8), and increasing number of male partners (p<.05) were associated with HIV infection in all groups.
Conclusions. Bisexuality in Latin American countries has different patterns than in other cultures and has modified the epidemiological pattern of HIV infection. Results show that bisexual practices are frequent, risk practices associated to HIV seropositivity are similar to the ones described in homosexuals. While heterosexual practices constitute protective factors for bisexual men, they represent a risk of transmission to their heterosexual partners.

W.G.P.26 HTLV-I SEROPREVALENCE IS INCREASED AMONG THOSE LIVING AT LOW ALTITUDE IN JAMAICA

Murphy, Edward L.*; Maloney, E.*; Figueroa, J.P.**; Gibbs, W.N. ***; Holding-Cobham, M.**; Cranston, B.***; Blattner, W.A.*.
*National Cancer Institute, Bethesda, USA, **Min. of Health, Kingston, Jamaica, ***U. of the W. Indies, Kingston, Jamaica.

Objective. To determine demographic and geographic determinants of human T-lymphotropic virus type I (HTLV-I) seroprevalence in Jamaica, an endemic island.
Methods. During 1985 and 1986, we measured HTLV-I antibodies using ELISA and Western blot in 13,000 Jamaican workers.
Results. HTLV-I seroprevalence was strongly age- and sex-dependent, rising from 1.9% (ages 10-19) to 9.0% (ages over 70) in men and from 2.0% (ages 10-19) to 18.6% (ages over 70) in women. Women were more likely to be seropositive than men (adjusted odds ratio = 2.23). Black men had marginally higher HTLV-I seroprevalence (M-H chi square = 0.06), but black women had equivalent prevalence to women of other races. Current residence at altitudes of less than 1000 feet (p = .003) and birthplace outside of the Kingston metropolitan area (women only)(p = .001) were significant risk factors for HTLV-I seropositivity, after stratification by age and gender.
Conclusion. Older age, female gender, and black race are known risk factors for HTLV-I infection in endemic areas. Higher HTLV-I prevalence in those residing at low elevation suggests transmission by an environmental vector, i.e., by arthropods.

W.G.P.27 HIV SEROPREVALENCE SURVEY AMONG HIGH RISK FEMALES AT MOMBASA, KENYA.

Mbugua, Gabriel*; Gachihi, G. S.*; Adaw, S.*; Mudme, F. M.**; Mandalya, K. N.**; Mupate, E.***
*Kenya Medical Research Institute; **Ministry of Health; ***Public Health Department of Mombasa Municipality.

Objective: To assess the prevalence and distribution of HIV infection among female prostitutes at Mombasa.
Method: 366 high risk females working in bars as barmaids, soliciting for men in bars and in Mombasa streets plus women known to entertain men in their houses in certain parts of Mombasa town were sampled using cluster method and recruited into the study. The women were asked to report to Communicable Diseases Control department at Ganjoni, Mombasa. While at the Ganjoni clinic, verbal consent was taken. 5 mls of blood samples were collected from the women and blood sera was later separated at Coast General hospital Laboratory, Mombasa and Enzyme Linked Immunosorbent Assay (ELISA) test using organon kit was done. A written questionnaire was administered by asking the study subjects questions and filling in forms.
Results: 144/366 (39.34%) women were ELISA positive for HIV; 80/366 (21.86% were positive for syphilis; 32/366 8.74% were positive for both HIV and syphilis; 48/366 (13.11%) were positive for syphilis alone and 112/366 (30.6%) had HIV alone.
Conclusion: The HIV infection among high risk females in Mombasa is definitely high and there is urgent need to organise counselling sessions for the patients.

W.G.P.28 PREVALENCE OF HIV-1 ANTIBODIES IN STD PATIENTS.

Hailu Kefenie*; Bekure, D.*; Seifu, M.*; Zewdie, D.** and Kebede, T.**.

* Armed Forces Hospital, Addis Ababa, Ethiopia.
** National Research Institute of Health, Addis Ababa, Ethiopia.

Objective. To determine the prevalence of HIV-1 antibodies in patients with STDs attending one of the clinics in Addis Ababa, Ethiopia.
Methods. Sera from 500 consecutive STD patients (496 males and 4 females) were examined for the presence of HIV-1 antibodies. The serological tests were carried out by ELISA (Wellcozyme) and confirmed by Western Blot (Biorad).
Results. Of the 500 tested 60 (12%) were HIV-1 antibody positive. The prevalence of HIV-1 antibodies varied with the type of STD:

STD diagnosis	No. of patients	HIV-1-Ab	%
Gonorrhea	194	17	8.8
Chancroid	85	16	18.8
Nongonococcal uretheritis	117	5	4.3
Lymphogranuloma venerum	21	3	14.3

Conclusion. The prevalence of HIV-1 infection among STD patients is 12%. This infection rate is higher than that of blood donors (1.6%) but lower than figures for prostitutes in Addis Ababa (18.8%).

W.G.P.29 HIV-1 PREVALENCE IN NAIROBI SENTINEL POPULATIONS.

Ndinya-Achola, Jackoniah O.*, Datta, P.*, Waiyaki, P.**, D'Costa, L.J.***, Ronald, A.R.****, Plummer, F.A.*,****.
*University of Nairobi, Nairobi, Kenya, **Kenya Medical Research Institute, Nairobi, Kenya, ***Nairobi City Commission, Nairobi, Kenya, ****University of Manitoba, Winnipeg, Manitoba, Canada.

Objective. To monitor the rate of change in HIV-1 in at-risk populations since the onset of the epidemic at the beginning of the decade.
Methods. Data accruing from all the studies related to sexually transmitted diseases (STD) and HIV conducted under the auspices of the World Health Organization collaborative centre for STD research and training within the Department of Microbiology, University of Nairobi from 1980 to 1988 were reviewed. The populations studied included men and women attending an STD clinic, pregnant women and a cohort of prostitutes living in one geographically defined area of Nairobi.
Results. HIV seropositivity (HIV+) rates increased from 0 to 24% in STD clinic patients, with the largest increase occurring in men with chancroid. Among prostitutes, the HIV+ increased from 3% to 80%. HIV+ in pregnant women increased from 0 to 3.7%.
Conclusion. HIV infection rate is spreading most rapidly in the Nairobi populations with the highest sexual activity. A slow but steady increase in prevalence of HIV+ in pregnant women suggests substantial spread to the general population.

W.G.P.30 HIV ANTIBODY TESTING AT AN ALTERNATIVE TESTING SITE IN HONG KONG

Li PCK, Yeoh EK, Lam WY, Leung PY, Ho YY, Lee YE et al.
AIDS Counselling and Health Education Service, Hong Kong.

Method: The AIDS Counselling and Health Education Service was established in November 1985 and provided anonymous and confidential HIV antibody test for individuals at risk of HIV infection. The clients were encouraged to discuss their at risk behaviour and appropriate counselling was given.

Result: Up to the end of December 1988, a total of 2,753 individuals agreed to have HIV antibody testing and 7 were found to be seropositive.

Result of HIV Antibody Testing

Risk Group		No. tested	No. +ve (%)
Homo/Bisexual -	Total	302	7 (2.3%)
	Chinese	264	5 (1.9%)
	Non-Chinese	38	2 (5.3%)
Heterosexual -	Chinese	2010	0
	Non-Chinese	270	0
IV Drug Abuser -	Chinese	62	0
	Non-Chinese	4	0

A total of 128 individuals requested HIV antibody testing because of various forms of contact with known HIV-infected individuals and only one homosexual partner of an HIV carrier was found to be seropositive.

Form of contact	No. tested	No. +ve (%)
Male homosexual partner	7	1 (14%)
Male heterosexual partner	3	0
Female heterosexual partner	6	0
Health care worker	84	0
Casual/household contact	28	0

Follow up HIV antibody tests were performed for 82 seronegative homosexuals and 263 heterosexuals after a median period of 8.7 months (0.9-32.8) and 5.1 months (0.3-32) respectively and only one homosexual showed seroconversion after 27.2 months.

Conclusion: The prevalence of HIV infection in a sample of homosexuals in Hong Kong ranged from 1.9-5.3%, being higher in non-Chinese. The prevalence in the heterosexual population is below 0.05%.

W.G.P.31 Approche Communautaire de la Lutte Contre le SIDA en Haiti

Gabriel A. THIMOTHE, Programme National de Lutte contre le SIDA, Port-au-Prince, Haiti

Le SIDA, phénomène biologique modifiant l'intégrité moléculaire de la cellule humaine, est aussi un problème social aux incidences morales, économiques et culturelles non négligeables.

Dans les pays en voie de développement comme Haiti, confrontés à l'insuffisance des services sanitaires de qualité, à la marginalité d'un large secteur de la population, et surtout à un taux élevé d'analphabétisme, l'action participative de la communauté, renforcée par une intégration multisectorielle dynamique semble être la méthode d'approche la plus efficace et la mieux adaptée. La structure organisationnelle du système national de santé régionalisé offre l'avantage d'une mobilisation progressive passant par une action concertée du niveau central, régional et communal. Cette transmission à triple palier permet d'atteindre les diverses couches sociales en utilisant les canaux de communication correspondant au degré de compréhension du public visé, tels les messages écrits, les conférences, les spots rediotélévisés, les contacts interpersonnels, les forums populaires, le porte-à-porte et les rencontres avec les leaders naturels.

Les médecins traditionnels, les sagesfemmes et le prêtres vodou participent comme canalisateurs ou animateurs à des journées communales de motivation sur l'éducation et la prévention tandis que des boys-scouts et des agents communautaires aident à réaliser des séances éducatives à l'occasion des fêtes patronales.

Cette perspective d'une participation consciente et volontaire des diverses composantes de la population est l'une des demarches tendant à relever un grand défi national: Epargner le pays de la destruction de sa jeunesse et de sa force productive du travail par une évolution anarchique du SIDA.

W.G.P.32 THE FAMILY AND CARE-GIVING IN UGANDA

I. Maxine Ankrah*, Monica Lubega, Stephen Nkumbi; *Department of Social Work and Social Administration Makerere University, Kampala, Uganda., Counseling Center, University Hospital, Kampala, Uganda.

Objective: To examine the ways that AIDS was reinforcing as well as changing the traditional attitudes and practices of families toward sick members.
Method: Pretest data of a quantitative survey of three rural and one urban district for the WHO-intercountry survey is analyzed and compared to observations of 40 families studied intensely over a five-month period.
Results: Rural populations do not admit having seen AIDS patients, or accept that their relatives suffer from the disease. They agree to a diagnosis of some other disease of witchcraft. Care is given by the family or other relatives. Where AIDS is associated with promiscuous behaviour, the persons who infected the patient should give care, or the patient, believed to be able to afford many partners, should care for him/herself. Since AIDS is seen as affecting heaviest the poor who cannot afford treatment for needles, medicines and hospitalization of relatives, governament must support families with AIDS cases. The extreme measures recommended included the guarantining of persons found to be HIV+.
Conclusion: Increased support of community based efforts to educate rural populations, the majority, and to identify local sources of family support indicated.

Aspects cliniques (partie 2)
Clinical Features (Part 2)

Th.G.P.1 HIV AND HTLV-I INFECTION AMONG HOMOSEXUAL AND BISEXUAL MEN IN KINGSTON, JAMAICA

Murphy, Edward L.*; Gibbs, W.N**; Figueroa, J.P.***; Bain, B.**; LaGrenade, L.**; Cranston, B.**; and Blattner, W.A.*.
*National Cancer Institute, Bethesda, USA, **Univ. of the W. Indies, Kingston, Jamaica, ***Min. of Health, Kingston, Jamaica

Objective. To evaluate prevalence and risk factors for infection with HIV and HTLV-I in Jamaican homosexual men.
Methods. From 8/85 through 1/86, 125 homosexual or bisexual men had ELISA/Western blot for HIV/HTLV-I and questionaire data.
Results. 12 men (10%) were seropositive for HIV and 6 (5 %) for HTLV-I; one man had possible co-infection with HIV and HTLV-I. Sexual contact with men in the U.S.A. was common, and was weakly associated with HIV infection (p=0.11). The median number of homosexual partners was 12 per year (range 0-135) and a greater number of partners per year was associated with HIV seropositivity (p=0.01). Lymphadenopathy was identified in several HIV seropositives. For HTLV-I there were no obvious risk factors identified, and age-adjusted seroprevalence was not significantly higher than that of heterosexual men.
Conclusions. HIV appears to have entered this population via sexual contact with foreign men and spread efficiently among men with a greater number of sexual partners. The frequency of bisexuality (65/125 men) and the 11% HIV prevalence in bisexual men suggest that secondary infection of female sexual partners may occur.

Th.G.P.2 RISK FACTORS FOR HTLV-I INFECTION IN PREGNANT HAITIAN WOMEN

Buff, Andrea*; Holt, E*; Wiktor, S**; Boulos, R***; Blattner, W**; Halsey, N*, et al
*Johns Hopkins University, Baltimore, MD; **National Cancer Institute, Bethesda, MD; ***Centers for Health and Development, Port-au-Prince, Haiti

Objective. To identify factors associated with HTLV-I infections in pregnant Haitian women.
Methods. Pregnant Haitian women were screened for HTLV-I, (ELISA and Wb) HIV-1, and syphilis.
Results. Of 2070 women, 89(4.3%) were seropositive for HTLV-I. Seroprevalence rates increased with age from 2.3% in women 14-19 years old to 8.4% in women over 34 years old. Regression analysis revealed independent associations with alcohol consumption (OR= 5.2,95%CI=1.2,23.2), HIV-1 seropositivity (OR=3.7, 95% CI=2.1, 6.8), smoking (OR=2.1,95%CI=1.0,4.2), and age >34 years (OR= 2.0,95% CI=1.1,3.9). HTLV-I seropositive women did not differ from seronegative women in marital, educational, or socioeconomic status, syphilis serology or prior use of family planning. Other potential risk factors, IV drug use and transfusions, are not prevalent in this population.
Conclusion. The increasing seroprevalence rates with age and the association with HIV-1 seropositivity suggest that HTLV-I is transmitted through sexual contact in this population. As our studies of HIV-1 risk factors also demonstrated, an association exists between seropositivity and smoking. We have undertaken additional studies in this population to determine the basis of this association.

Th.G.P.3 HIV INFECTION AMONG PROSTITUTES AND TRANSVESTITES IN BRAZIL

Aoki, Francisco Hideo; Lima, J.N.; Abreu, W.B.; Monteiro, D.T.; Pavan, M.H.P.; Pedro, R.J. et al
UNICAMP, Campinas, Sao Paulo, Brazil.

During 1988 HIV testing was done among prostitutes and tranvestites who spontaneously reported to a health clinic located in the prostitution area in Campinas, southeastern Brazil. Tests were performed using the ELISA (recombinant DNA) antibody assay and Western-Blot (WB) antibody assay. One hundred and two individuals were tested: 21% were male and 79% female. The age ranged from 14 to 50 years but 61% were 20 to 30 years old. Most (79%) were prostitutes, 19% male homosexuals and 2% male bisexuals. Among the prostitutes 15% reported IV drug use. The first 42 individuals were tested by ELISA (2 samples) and WB. 35.7% had antibodies by both methods and 64.3% did not have antibodies by both methods, showing a sensitivity and predictive value of 100% for the ELISA test when compared to the WB test in this high risk population. The 60 ensuing patients were tested only through ELISA. The overall prevalence of HIV antibody positive individuals in the population studied was 21.5%.

Th.G.P.4 MERCHANT SEAMEN: A RISK POPULATION FOR HIV INFECTION?

Cornejo, Mónica; Jerez, R. and Casanova, D.
University of Valparaíso, Valparaíso, Chile.

In Valparaíso (principal port of Chile) 3/30 HIV infected people had been heterosexual merchant seamen, 2 of them had transmitted the infection to their wives.
Objective. To determine if merchant seamen could be a risk group for HIV infection and a factor in the propagation to the female population in Chile.
Methods. After informed consent was obtained a questionnaire was administered to 452 healthy seamen with at least 1 year of international travels. Simultaneously blood was drawn for HIV Ab and HIV Ag determination (Organon).
Results. The mean age was 36.7 years. 75.9% had medium or high level scholarity. In the last five years, 64.6% had frequently travelled abroad. During this period 7.3% had undergone surgical procedures, 1.3% had received blood transfusion, 35.2% inyections, and 3.10% tattoos. 100% of the subjects declared heterosexuality, 78.3% were married. 65.6% admitted multiple sexual intercourse predominantly with prostitutes of South America (Ecuador, Perú, Brasil) and Europe (UK,FRG) and 22.3% other S.T.D. Only 3.9% used condom. Marital status and education were not significantly associated with risk sexual behaviour and use of condom. HIV Antibody and HIV Antigen was not detected in 442 and 249 serum samples tested.
Conclusion. HIV infection was not demonstrated in this study, however the high frecuency of sexual contact with different foreign prostitutes may be a risk factor for this group and their female partners in Chile.

Th.G.P.5 PREVENTIVE INTERVENTION FOR HIV IN STD CLINICS IN ZAMBIA.

Hira, Subhash*; Matondo, P.*
*University Teaching Hospital, Lusaka, Zambia.

Zambia is the only sub-saharan African nation with a STD control programme. It was launched in 1980 and has expanded to include a network of 38 STD clinics providing standardised treatment, contact tracing, counselling and surveillance. The male:female attendance ratio has improved from 5:1 in 1980 to 2:1 in 1987. The prenatal syphilis screening and treatment programme introduced in 1984 has reduced seroprevalence of syphilis in pregnant women in Lusaka from 12.8% in 1983 to 8.0% in 1987.
With high seroprevalence of HIV among STD attendees, it is single, easily accessible target population where health education, counselling and condom promotion can be highly successful in reducing HIV transmission.
Conclusion. Other nations can benefit from this model programme to establish similar programmes and introduce preventive intervention for HIV.

Facteurs de risque liés aux MTS (partie 2)
STD Risk Factors (Part 2)

Th.G.P.6 DETECTION OF HIV-1 FROM FILTER PAPER BY POLYMERASE CHAIN REACTION (PCR).

Shlomit Orgad; Korber B.; Marlink R.; Kanki P.; Essex M.
Harvard School of Public Health, Harvard University, Boston, MA USA.

Objective: To determine the suitability of collecting whole blood specimens on filter paper for HIV-1 DNA detection by PCR.
Babies born to HIV-1 seropositive mothers may carry anti HIV-1 antibodies which may have been transferred across the placenta.
At present, one must either isolate HIV by cocultivation or demonstrate viral DNA to determine the actual infection of the newborn. PCR is a newly developed method which enables detection of a minute amount of DNA.
Methods. Blood from known HIV-1 seropositive patients and known controls was collected by freshly spotting Whatman #3 filter paper, approximately 1 cm in diameter. The papers were kept in plastic bags at room temperature for 4-5 weeks. DNA was extracted by digestion with SDS and proteinase K followed by phenol-chloroform extraction and ethanol precipitation. Pellets were resuspended in 100 µl TE buffer. 2-5 µl of the DNA suspension was then used for DNA amplification by PCR. PCR was performed using HIV-1 specific primers for the gag, env, and LTR regions. The PCR product was dot-blotted and hybridized with p^{32} labelled probes of these three regions. Results were compared to HIV-1 DNA isolated from infected tissue cultures.
Results. We performed PCR amplification of DNA extracted from whole blood collected on filter paper from HIV-1 seropositive patients. Using this technique we have been able to detect the presence of HIV-1 viral DNA in minute quantities of blood.
Conclusion. Detection of HIV-1 by PCR, from whole blood collected on filter paper can be performed effectively. This method can facilitate diagnosis of HIV-1 in situations where (1) storage of blood may be logistically difficult: ie. in developing countries and /or (2) when the amount of blood available is very small, i.e. in newborns.

Th.G.P.7

LIAISON ENTRE LA DENSITE OPTIQUE EN ELISA ET LE RESULTAT DU WESTERN BLOT CHEZ LES DONNEURS DE SANG DE BRAZZAVILLE (Congo)

Michel ROSENHEIM*, P. M'Pelé**, A. Itoua-Ngaporo**, N. Copin** F. Yala**, M. Gentilini* - *Dpt de Médecine Tropicale, Hôpital Salpêtrière, Paris, France. **CHU de Brazzaville, Congo.

Il existe au Congo un taux d'environ 40% de sérums positifs en ELISA et douteux en Western blot (WB) car contenant des anticorps anti-core, le plus souvent anti p24 sans anti gp.
Nous avons tenté de trouver une liaison entre la densité optique en ELISA et le résultat en WB.
Le réactif utilisé est ELAVIA Pasteur dans lequel le seuil positif est de 0.300. Cette étude a été faite sur 230 sérums et a donné les résultats suivants :

	0,3 < DO < 1	DO > 1
Western blot négatif	76	4
Western blot p24 isolé	55	9
Western blot positif	5	81

Cette distribution diffère de façon très hautement significative de celle qui aurait été obtenue par hasard (Chi carré = 162, p<0,0001).
Si on assimile les sérums p25 isolée aux sérums négatifs, l'odds ratio est de 163 (de 74 à 361). On peut donc définir la positivité en ELAVIA par une DO supérieure à 1, afin d'"économiser" les réactifs de Western blot.

Th.G.P.8

RAPID METHOD FOR DETECTION OF HIV1 AND HIV2 INFECTIONS : EVALUATION OF SENSITIVITY AND SPECIFICITY

G. Cilla*, Daniel Zulaica*, E. Perez-Trallero*
* Hospital Ntra-Sra de Aranzazu, San Sebastian, SPAIN

Objective : Evaluation of sensitivity and specificity of a rapid test (HIV CLONATEC) in the diagnostic of HIV1 and HIV2 infections by comparison with ELISA methods and western blots.

Methods : This rapid HIV test (CLONATEC/V-TECH) is an immunofiltration device which involves synthetic peptides (SYNTRO) as antigens to detect anti-HIV1 and anti-HIV2 antibodies.

Results : 484 sera from intravenous drug addicts were tested in the rapid test. 272 samples are positive for anti-HIV1 antibodies in ELISA (Vironostika anti-HTLV III - ORGANON / ELAVIA Ac-Ab-AK I - PASTEUR) and 212 samples are negative (ORGANON). 271 are positive in the rapid test with the HIV1 peptide (sensitivity of 99,6 % for the HIV1 peptide). 409 sera from the same group of samples were tested for the presence of anti-HIV2 antibodies. 314 are negative, 19 are unconclusive and 76 are positive in the ELAVIA Ac-Ab-AK II (PASTEUR). All are negative in the rapid test with the HIV2 peptide. Unconclusive and positive sera in the HIV2 ELISA are positive for anti-HIV1 antibodies in the two HIV1 ELISA. 34 sera among the 76 positive were tested by western blot (Novapath TM Immunoblot Assay (BIORAD) for HIV1 and Lav blot II (PASTEUR) for HIV2). All these sera were confirmed to be anti-HIV1 specific and no reaction was observed against envelop (gp 105) proteins in the HIV2 blot. All these sera are negative in the rapid test with the HIV2 peptide. These results show the great specificity of the HIV2 peptide in the rapid test.

Conclusion : 484 sera from a high risk population were compared in two Elisa tests, in the Target test and confirmed by western blot. The sensitivity of the rapid test is 99,6 % and specificity is 100 %.

Th.G.P.9

MODIFIED WESTERN BLOT ASSAYS FOR HIV INFECTION

Sunil K.Arora and S.Sehgal, Deptartment of Immunopathology, Postgraduate Institute of Medical Education and Research, Chandigarh 160 012 (INDIA)

Six thousand sera were screened for HIV infection as a serosurveillence exercise at the P.G.I.M.E.R., Chandigarh, one of the national surveillence centers. The overall positivity rate was 3% by ELISA. Western Blot assay is the acid test for confirming a diagnosis of HIV infection but the cost of WB kit is prohobitive. It was thus imperetive to evolove a more economical system in developing countries. In the present study various reaction systems were tried:a)Protein A labelled to peroxidase, b) a three step procedure using anti-human rabbit and anti-rabbit labelled to peroxidase, c) an equivalent of a PAP system in tissues. It was found that results obtained with these reagents were comparable to those of avidin/biotin reagents supplied along with the kit. The strips stored at 4°C for 12-18 months also gave satisfactory results. The background was minimum with protein A.
Thus with indigenously raised antisera and protein A conjugated peroxidase effective time and cost of WB can be reduced substantially. The system can be applied to cases with strong clinical suspicion. The Dupont kit may be reserved for borderline cases.

Th.G.P.10

FDA REFORM: AN ACTIVIST PERSPECTIVE ON THE NEED FOR LEGAL AND REGULATORY CHANGE.

Harrington, Mark; Eigo, J.; McCarthy, M.; Long, I.; Kirschenbaum, D.Z. AIDS Coalition to Unleash Power, New York NY, USA.

Objective: To propose methods of removing regulatory and legal obstacles to faster drug trials and wider access to experimental treatments. Methods: Analysis of protocols, budgets, subject demographics, oversight hearings and discussions with officials. Discussion: Drug approval in the USA takes 8-10 years, longer than many PWA's can expect to live. Current drug approval standards lag behind advances in biotechnology, statistics modeling, toxicology, immunology and virology, and patient advocacy. FDA oversight, inadequate until the NDA stage, is often arbitrary and restrictive. Companies conduct poorly designed trials wasting of time and lives. Poor people cannot participate in clinical trials due to lack of third party reimbursement. Conclusion: FDA must redefine toxicity standards and efficacy endpoints flexible enough to allow for growing knowledge of HIV disease. FDA staff must be expanded to cope with new responsibilities. Members of the AIDS community and ethicists must participate in IRB's and FDA advisory review committees. Health care, and not simply "pure data" must become an acknowledged part of the trials system.

Th.G.P.11

BLINDED BY SCIENCE: DHPG AND THE CONFLICT BETWEEN "CLEAN DATA" AND HUMANE HEALTH CARE

Harrington Mark; Wiley, K.; Eigo, J. AIDS Coalition to Unleash Power, New York NY, USA.

Objective: To use the trajectory of DHPG (Ganciclovir) through the regulatory maze to exemplify problems impeding drug approval and up-to-date health care. Methods: We contacted Syntex Corp., negotiated with FDA and NIAID, read the protocols for the controlled "delayed treatment", treatment IND and compassionate use protocols, and talked with ophthalmologists, community physicians and persons with CMV infection. Discussion: DHPG is effective in over 80% of those treated for CMV infection, and is approved in 4 European countries. Because the data were derived from a compassionate, uncontrolled trial, FDA rejected Syntex' 1987 NDA application, instituting instead 3 interlocking trials, under which 40 persons would be untreated until progression of retinitis. Here, demands for data derived from "adequate and well-controlled trials" superseded concern for the 20% of PWA's endnagered by CMV. Conclusion: Provision must be made for accepting evidence of efficacy when thousands have responded well to a therapy and when there is no approved alternative. "Clean data" modalities must be modified during the AIDS pandemic to speed effective drugs to those at risk.

Th.G.P.12

NIH/NIAID - WHO AIDS Research and Reference Reagent Program.

Stern, Susan*, Mosl, L. and Milman, G. ERCI* and Pathogenesis Branch, AIDS Program, NIAID, NIH, Bethesda, Maryland, U.S.A.

The National Institutes of Health AIDS Research and Reference Reagent Program (Repository) in Rockville, Maryland is one of three collaborating centers established by the World Health Organization Global Programme on AIDS to facilitate the exchange of reagents needed for biochemical research on AIDS and related retroviruses. The repository distributes samples of cells, clones, virus isolates, and antibodies to qualified investigators worldwide, whose research relates to AIDS. Currently available materials include:

- Antibodies: Polyclonal and Monoclonal
- Cloned Provirus
- Expression Systems/Cloned cDNA
- Infected and Uninfected Cells
- Virus Isolates
- Biologics, Chemicals and Drugs

The repository relies heavily on reagents from individual laboratories. Scientists who wish to contribute to the program should contact the Principal Investigator regarding suitability and other requirements of submission. Contributors will be cited in the reagent catalog as the source and acknowledged in publications by the recipient. Contributors may also receive reports on the requests for their reagents. The repository encourages collaborative research aimed at standardization of reagents and of laboratory techniques. Future plans include the distribution of standardized protocols. For further information contact Dr. Stern by telephone at 301-340-0245 or FAX 301-762-4170.

Th.G.P.13 PHASE–I STUDY OF RECOMBINANT PEPTIDE CORRESPONDING TO THE GP41 TRANSMEMBRANE PROTEIN OF THE HIV-1 VIRUS COUPLED TO FICOLL

Dietrich, Manfred* ; Schwander, S.* ; Hanson, D.** ; Letwin, B.** ; Schindler, J.**
*Bernhard-Nocht-Institute for Tropical Medicine, Clin. Dept., Hamburg, Germany, **Biogen Inc., Cambridge, Mass., USA.

Objective. Animal experiments demonstrated that short polypeptides coupled to Ficoll can produce a T-independent immune response in nude mice. The T-independent response engages only IgM antibodies. Antibodies directed at appropriate HIV epitope could possibly block an ongoing infection of newly born T-cells with the virus as well as inhibit the formation of syncitia between infected and healthy cells.
Methods. F-46 is a recombinant peptide equivalent to conserved regions of the gp41 of HIV-1 coupled to Ficoll. In order to evaluate the toxicity and tolerance of this Ficoll-coupled peptide, a phase–I study was performed in 14 patients with AIDS with different numbers of T-cells. Peptide was injected intramuscularly with either 0.1 mg or 0.3 mg. Four patients were boostered later on twice with a time interval of 4 weeks, one patient could be boostered only once. The patients were monitored carefully by laboratory and clinical examinations and antibodies were measured at days 0, 7, 14, 21, and 28, months 3, 6, 9, and 12 after injection.
Results. All patients tolerated the injections well without any significant side effects. The haematological as well as biochemical parameters did not show any signs of toxicity. There was a significant increase in antibodies against the peptide after the first injection with significant fall during the first four weeks. Details of the antibody responses of all patients including the boostered patients will be presented during the conference.

Th.G.P.15 THE ROLE OF FEMALE PROSTITUTION IN THE HETEROSEXUAL AIDS EPIDEMIC IN SOUTH AFRICA

Schoub Barry D*; Martin D*; Smith AN*; Lyons SF*; Padayachee GN**; Naidoo S.**
*Medical Research Council AIDS Virus Research Unit†, National Institute for Virology, Sandringham, South Africa, **Johannesburg City Health Department. South Africa

Many studies in Central and East Africa have confirmed the pivotal role of female prostitutes in the establishment, maintenance and expansion of pattern 2 (African) AIDS. In South Africa, until the latter part of 1987, no cases of AIDS were reported in the black population, while in the white population three cases observed in 1982 had risen to 48 (predominantly male homosexuals) the end of 1987. Since the end of 1987 the number of cases in black South Africans (all heterosexuals of both sexes) has risen sharply to 24 by mid-January 1989 and the role of promiscuous women in the development of this epidemic is confirmed by seroprevalence studies carried out in a number of sentinel cohorts - e.g. among STD attenders, 1.3% of females were positive as at December 1988 in contrast to nil of the same population at the end of 1986/87 (Trans Roy Soc Trop Med Hyg 1987, 81: 874-875); male STD attenders had a somewhat lower prevalence of 0.66%. The female:male dominance was also seen in other cohorts and even in black blood donor populations - 0.1% versus 0.06% respectively. The reproductive rate (Ro) of the heterosexual epidemic is, to a major extent, influenced by the characteristics of this core of promiscuous females and control measures need to be focussed on shrinking this core. Identification of prostitute populations in developing societies is far more difficult than in developed countries and licensing measures for control are virtually impossible because of the poor definition and transience of this population.

Th.G.P.17 HIV-INFECTION IN PREGNANT WOMEN AND THEIR INFANTS IN ARGENTINA

Casiró, Arnaldo*;Uranga Imaz,F*;Capdevila,A*;Rickard,E**; Astarloa,L***;Cahn,P*,et al.
*Hospital Fernández,**Academia Nacional de Medicina,***Hospital Muñiz,Buenos Aires,Argentina.

Objective. To present the first communication on HIV perinatal transmission in Argentina.
Methods. A total of 19 HIV-reactive mothers(HIV-Mo)was studied through EIA HIV-1 and Immunofluorescence in 1988. Their children(CH)were studied also thru ENVACORE and HIV-1 Antigen Abbott(AG). Birth characteristics, Apgar index and weight were assessed, and clinical and serological follow-up of CH was made thru periods of 3 to 18 months(m). Also, 2 CH from hemophilic father and HIV-Mo, which births took place at another center, were studied.
Results. In 1988, 19 pregnant HIV-Mo were attended. HIV-Mo risk factors were: IVDA:17;HIV+IVDA partner:2. Age($\bar{x}$):21 years old. Obstetric outcome:abortion: 1;premature birth and dead fetus:1;vaginal birth:13;caesarean section:4(23.5%) Birth weight($\bar{x}$):2,982 gr(general population:3,300 gr).Gestational age($\bar{x}$):39 weeks.Apgar index($\bar{x}$):1 min=8; 5 min=9(range:1'=2-9; 5'=6-10).One CH dropped out.Out of 18 CH,17 were HIV+ at birth. AG:17(-) and 1(+); this one had + HIV culture. Five CH were ENV+ CORE- and 12, ENV+ CORE+. Ten CH were followed up from 3 to 18 m. The seronegative CH showed seroconversion at 18 m(ENV+ CORE- AG-), and clinical signs at present. Three cases turned negative at 8,9 and 16 m, respectively; the others remain unchanged. Out of 7 CH with clinical signs, 4 were ENV+ CORE- and 3, ENV+ CORE+.
Conclusion.HIV perinatal transmission is a problem,even in countries with few AIDS cases. HIV-infection did not alter the obstetric or neonatological features of this population. ENVACORE and AG did not help identify infected CH.-

Th.G.P.14 AFRICAN HIV EDUCATION MOBILIZED THROUGH A PUBLIC-PRIVATE WORKSHOP

Wright, Lester*; Elder, H.**; Hart, R.***
*Oregon Health Division, Portland, OR, USA; **Jerry Pettis Memorial Veterans Hospital, Loma Linda, CA, USA; ***Loma Linda University, Loma Linda, CA, USA.

Objective. To help health care professionals in Africa develop locally based HIV education programs (LBHEP).
Methods. A church with its US university and local mission hospital sponsored a workshop in Malawi in cooperation with the Government of Malawi, the Private Health Association of Malawi, and WHO. Presentations described goals necessary to control HIV spread. Working in small heterogenous, multinational, groups, 200 participants from 15 African countries identified problems and developed solutions. These were combined into a document to be used in LBHEP.
Results. The broad sponsorship provided wide acceptability of the workshop to many different groups--including various mission organizations and government. The diversity of participants resulted in stronger, more realistic plans for patient counseling, home care, public health measures, and HIV education. Evaluation showed participants considered this workshop "African" because the proceedings and conclusions were by and for Africans. Most expected to make changes in their practices based on the workshop.
Conclusion. The model of private-public cooperative effort utilizing national health workers to describe and resolve problems can facilitate LBHEP and may be broadly applicable.

Epidemiology

Th.G.P.16 ATTITUDES EXPLAINING DESSERTION AND NO-USE OF CONDOMS IN GAY MEN IN MEXICO.

IZAZOLA ANTONIO*, BASAÑEZ R*, VALDESPINO J.L*, SEPULVEDA J.*
Directorate of Epiemiology. Ministry of Health. Mexico

Objective: To describe the attitudes that may explain dropping condom use or refusing its use.
Methods: In september 1988, a survey to determine knowledge, attitudes, opinions and practices related to AIDS and condom use was carried out in gay men in the second largest city in Mexico. Data about attitudes were collected through agreement or disagreement of several statements about condom use. The comparison groups were the never users (non users), ever but not recent users (dessertors), and current users of condoms (active).
Results: Main results are shown in the next table:

Statement	active users (162)	dessertors (47)	non users (74)	p
Preferable to run the risk than use a condom	33%	45%	63%	<.001*
Condoms take away the romance	36%	40%	58%	<.05 *
Your partner will reject you if you use a condom	26%	38%	45%	<.05*
Condoms are appropiate for yoy	96%	74%	47%	<.001*
Condoms must be part of sexual routine	96%	79%	73%	<.001*
Condoms frequently break or don't fit	64%	94%	73%	<.001**
Condom use is not effective to prevent AIDS	10%	57%	35%	<.001**
Condom use make your partner think you have AIDS	40%	62%	38%	<.05 **
If you suggest to use a condom people feel agression	75%	63%	65%	N.S. **

*Trend Chi square **Mantel-Haenszel Chi square correction.

Conclusion.- The reasons for dessertion may be explained as follows: "dessertors" are not convinced of the preventive effectiveness of condom use, or their partners may think that if they propose the use of a condom it is because they might have AIDS, and/or a condom breaks when they are used; on the other hand, the "non users" are more likely to run the risk than using always a condom, that its use takes away the romance of the moment and that partners reject them when a condom is proposed. Continuity in condom use exists when the user feels that condoms are part of sexual life.

Th.G.P.18 AIDS SURVEILLANCE AND PREVENTION IN UGANDA

Dr. Samuel Okware*, Berkley S. F.,** Neamare W.*** Sutherland D.****

A review is made of the current status of the AIDS epidemic in Uganda following the establishment of a national AIDS Control Programme in 1987. A simple surveillance reporting system was established to follow progression of the disease. By Dec. 1988 close to 6000 cases have been reported from all the districts. 47% were males. 53% females. The doubling time of cases was 3 - 6 months. The age distribution shows over 85% are between 15 - 40 yrs, about 10% 0 - 5 yrs, only 11 cases have been reported between 5 - 14 years. The mean age for males was older than females (28.6 versus 24.4 years).

A national survey yielded a similar pattern, but with a younger mean age. Sentinel surveys is suggested as appropriate for monitoring future disease trends and progression.

The review shows heterosexual transmission is responsible for over 85% of cases, vertical maternal transmission about 10% and blood transfusion about 1%. Risk factors in transmission are discussed and increased number of sexual partners and sexually transmitted diseases are important amplifiers of transmission. The relative risk (odds ratio) increases proportionately with increased number of partners or episodes of STDs. The social cultural complications in disseminating health education and information is discussed. The social economic impact pf health education is also reviewed.

* Director of Ugamda National AIDS Control Programme.

Th.G.P.19

AIDS AND AFRICAN WOMEN

E. Maxine Ankrah, Department of Social Work and Social Administration, Makerere University, Kampala, Uganda

Objective: To expose the perceptions of HIV and AIDS of women and girls who are not targeted in subgroups of prostitutes, barmaids, pregnant women, and to identify unique cultural behaviors and attitudes.
Method: The gender dimension of a pretest of an instrument designed as part of an intended national WHO/Uganda KABP/Partner Relations Survey was administered to 300 respondents in the general population of three rural and one urban district. About 50% were girls and women. Survey data is supplemented by focus group discussions held in two urban settings with urban-based educated professionals and business women, and in one rural community with peasant women.
Results: The women view themselves as suffering disproportionately from HIV and AIDS. Age at first sexual contact at between 14 and 15 while boys stated an age of 17 men. They were less able to make decisions about sex and felt more exposed to infection. Women contract HIV from husbands who are free to have many partners. Wives of polygamous marriages may have sexual relations outside the union, thus increasing exposure. Poor women use sex to earn a living for themselves and children. Women who transmit the disease perinatally bear a heavy burden of anxiety, guilt, fear, and grief. Most women are unaware of measures through which they can change their situations.
Conclusions: Present AIDS campaigns do not target whole populations of women, the majority. Special interventions are needed to involve them in efforts of prevention and control of AIDS.

Th.G.P.21

HETEROSEXUAL TRANSMISSION OF HIV-INFECTION IN HEMOPHILIACS

Rickard,Ema;Muchinik,G;Manca,M;Campestri,R;Pérez Bianco,R;de Tezanos Pinto,M
IIHEMA,Academia Nacional de Medicina,Buenos Aires,Argentina.

Objective. This ongoing study is designed to evaluate the rate of HIV heterosexual transmission among female-partners of hemophilic males.
Methods. Serum samples were tested for HIV antibodies (Ab) by means of the enzyme-linked immunosorbent assay(ELISA,Abbott). Samples reacting positive by ELISA were tested by means of immunofluorescence(IF)and of a competitive immunoassay(Abbott), employing recombinant DNA-produced HIV proteins(ENV/CORE) as antigen.
Results. Out of 156 HIV Ab-positive hemophiliacs,47(30%) have stable sexual partners, out of whom 32(68%) females were studied:7(22%) were HIV Ab-positive, including 1 with AIDS-related complex(ARC) and antigenemia.
Conclusion. These results indicate that heterosexual contact may be an important means of transmission of HIV among hemophiliacs. Out of these 7 women,3 got pregnant and, up to now, we have 2 births: 1 was culture-positive and the other has positive serology.

Th.G.P.23

"LES PRATIQUES ET MOEURS SEXUELLES AU SENEGAL (CONTRIBUTION A LA CONNAISSANCE DU SIDA)

GUISSE Y. MB. IFAN CH. A. DIOP DAKAR-SENEGAL
D'ALMEIDA L. "PLURALE BP. 5356 DAKAR-SENEGAL
BIENVENU E. S/C LAB. BACTERIOLOGIE H. LE DANTEC DAKAR

OBJECTIFS: Elle s'interroge sur: la nature des pénétrations sexuelles (vaginale, rectale , orale); les natures des produits utilisés; les idéologies et représentations liées aux moeurs sexuelles.
METHODES: Des entretiens semi-directifs auprès de prostituées, de matrones, de maîtres et maîtresses de cérémonies rituelles sont entrepris dans 4 grandes régions du pays. Un questionnaire centré autour de 14 thémes relatifs à la sexualité est passé auprès de 1.575 personnes.
RESULTATS: L'étude analyse leur rapport à la contamination du SIDA et tente des propositions de prises en compte de ces réalités dans la prévention des MST. et du SIDA.
CONCLUSIONS: Cette étude permet d'apréhender leur part hautement significative comme mode de contamination du SIDA.

Th.G.P.20

CONNAISSANCES, ATTITUDES ET COMPORTEMENT A L'EGARD DU SIDA DE LA POPULATION RWANDAISE

Mulisende G., Ndibisheye N. Nsarambe D. Lehman F. and Careel M.

Objectifs Evaluer les connaissances, attitudes et comportement de la population rwandaise pour évaluer et orienter les campagnes de prévention du SIDA.
Methode Une enquete répresentative nationale par interview standardisée en langue nationale selon le protocole du GPA/OMS a été conduite en 1988 auprès de 1488 et 1315 personnes agées de 15-49 ans en milieu rural et urbain.
Resultats La très grande majorité - 98% - connait le SIDA et 90% savent que le SIDA se transmet par les relations sexuelles mais un tiers des répondants partagent des conceptions erronées sur les modes de transmission par les contacts quotidiens. 60% savent qu'on ne guérit pas du SIDA et 70 et 58% en milieu rural et urbain déclarent qu'il est impossible ou très peu probable qu'il leur arrive d'être infectés. 80% sont partisans de la moderation sexuelle pour eviter le SIDA. 3 et 8% respectivement ont eu d'autres partenaires que leur conjoint dans les 6 derniers mois. 1 et 7% ont déjà utilisé les preservatifs.
Conclusion Le niveau des connaissances aussi bien en milieu rural qu'urbain est considérable mais ces connaissances ne sont pas encore suffisamment intégrées dans les comportements individuels: l'indice de proximité du risque pour l'infection à VIH reste faible: l'enquête nationale CAP a permis de reorienter les strategies éducatives.

Th.G.P.22

HIV IN MOZAMBIQUE. A GENERAL OVERVIEW.

F.de la Cruz, J. Barreto, C.Palha de Sousa,L.Barquet
Immunology Laboratory, Instituto Nacional de Saude, Maputo,Mozambique.

Objective: To present a general overview of the HIV situation in Mozambique assessed through seroepidemiological studies and AIDS cases diagnosis.
Methodology: Seroepidemiological studies were carried out on samples drawn up from: the adult urban population of the main country's cities selected by a cluster sampling method; blood donors; STD patients; pregnant women and war displaced populations. HIV 1 and HIV 2 antibodies were detected by commercially available ELISA and WB kits. AIDS suspected cases were serologically confirmed by ELISA and WB. Symptoms and signs reported were recorded and analysed.
Results:The seroepidemiological studies shown the existence of HIV 1 and HIV 2 infection all over the country. Seroprevalences of 1.17% for HIV 1 and 2.1% for HIV 2 were estimated for the urban adult population. HIV 1 and HIV 2 infection rates among blood donors were lower than those found in general population. HIV 1 infection rate was higher in STD patients and war displaced populations whereas HIV 2 infection rate do not show remarkable differences.Results also suggest that HIV 1 infection is more common in rural than in urban areas whereas HIV 2 is not. By January 1989, 27 AIDS cases serologically confirmed as HIV 1, HIV 2 and HIV1/HIV2 positives have been reported. Their number is below the expected one. The value of the used approach for the assessment of the HIV epidemic situation and for the definition of sentinel groups for its monitoring is discussed.

Th.G.P.24

INCIDENCE OF HIV INFECTION AMONG FEMALE INFERTILE PATIENTS

Samundi Sankari, S*; Lalitha, A; Raji Bai, A; Suneethi, S; Sukanya, S; Chitraleka, S.
* Asst. Professor, Madras Medical College, Madras University, Madras, India

Aim and Objective : With regard to the prevalence of STD among infertile individuals, a comparative analysis of incidence of HIV infection, Serum hepatitis, Chylamydiasis, Syphilis and gonorrhoea among females attending infertility clinic was carried out.
Methodology : 120 female infertile patients were screened for HIV infection. Of them 70 infertile females, 35 with tubal block and 35 with normal tubes were chosen for the Pilot Study, in the city of Madras, where 80% of the HIV infected individuals in India had been detected. In the wake of the finding that 95% of the Seropositive individuals for HIV are women, the study was undertaken to find a correlation between HIV infection and infertility and other infections which are major causes of infertility. HIV Screening by ELISA : HBS Ag Screening by ELISA; Chlamydial Monoclonal antibody test; Blood STS, cervical smear for gonococcal infection.
Results & Findings : 2% (women) & 5% (husbands) History of Multiple partners

State of Tubes	Anti chlamydial Antibody Ig G	VDRL	Smear for Gonococci	HBS Ag	HIV	HIV alone 50
35 blocked tubes	Cases 14 40%	2 5.74%	Nil	2 5.74%	Nil	Nil
35 normal tubes	Cases 7 20%	1 2.84%	Nil	2 5.74%	Nil	

Conclusion : From this Pilot study we conclude that HIV infection is not associated with female infertility, inspite of presence of other STD causing infertility.

Th.G.P.25 HIJRAS: A CULT SUSCEPTIBILITY FOR AIDS

Dr. Gilada I.S., Secretry-General, Indian Health Organsation, Bombay,India.

The prevalence of AIDS as related to sexual preferences and patterns of function seems to be a significance that will determine epidemiological action. That sexual functioning have socio-cultural determinants is a vexing problem for sexologists.

The Hijra cult revolves around deity worship of a goddess figure (Baitraj Mata) and a hierarchial epicentre in a small town in Gujarat, a west Indian state.

Membership is granted after a commitment to spend a life time of devotion to the goddess.

The initiation is completed by a ceremonial castration, by a senior member of the cult called "Dai-Ma" after intoxicating the individual with alcohol and the ceremony is carried out in the loud noise of drum beatings. Adult life of Hijra is patterned as Male Homosexual Prostitute.

The present study is a preliminary report of attempting to define the topography of AIDS prevalence in this group. Epidemiological, Clinical and Laboratory finding are presented.

Th.G.P.26 EPIDEMIOLOGICAL FINDINGS OF HIV INFECTION AMONG WOMEN IN SAO PAULO, BRAZIL.

FERREIRA A[1]; Grandi J[2]; Fernandes M[2]; Accetturi C[1]; Pinto W[2].
1.Paulista School of Medicine-Infections Diseases Unit. Sao Paulo
2.Reference Center for AIDS - Sao Paulo, Brazil.

Objective:To evaluate the extension of HIV infection of women from Sao Paulo state.

Methods:Among the women(10y old)registered in two Out-patient care Units from Jan 84 to Jan 89 a sample of 611 were studied.The test used was ELISA and confirmed by W.B.techniche.The seroprevalence of HIV infection among sexual partners,IV drug abusers and blood transfusion receipts was determined.Others epidemiological aspects will be analyzed.

Results:Seroprevalence of HIV antibody in those groups

	Sexual Partners		IV drug abusers		Blood receipt		Ind	Total
HIV POS	81	33%	76	74%	22	48%	20	199
HIV NEG	163	67%	26	26%	23	52%		212
Total	244	100	102	100	45	100		.411

Conclusion:Many aspects of HIV infection in women will be emphasized.One of the most important is that among the IV drug abusers the seroprevalence(74%) was significantly higher than in the sexual partners (33%).

Th.G.P.27 EPIDEMIOLOGICAL FEATURES OF PEDIATRIC AIDS IN THE CARIBBEAN

Narain, Jai P*; Mahabir S,* Hospedales J;* Bassett D.*
*Caribbean Epidemiolgy Centre, Port-of-Spain, Trinidad.

Objective. To describe the epidemiology of pediatric AIDS in the Caribbean.

Methods. AIDS cases, both pediatric and adults, reported to the Caribbean Epidemiolgy Centre, (CAREC), Trinidad from 18 English speaking Caribbean countries and Suriname were analyzed.

Results. As of September 1988, 79 children with AIDS were reported to CAREC, comprising 8.7% of all AIDS patients. Of these, 66 (83.5%) were under 5 years of age. The number of pediatric AIDS cases increased from 11 in 1985 to 30 in 1987 (compared to 115 in adults to 267 respectively), 89.1% of children with AIDS were from Bahamas (40 cases), Trinidad and Tobago (22 cases) and Jamaica (9 cases). Males predominated among both adults (75.7%) and children (57.3%). Information on risk factors was available for 49 children; 47 (95.9%) wer born to parents with AIDS or HIV infection, in Two (4.1%) no risk factor could be identified.

Conclusion. Pediatric AIDS is now a serious problem in the Caribbean and almost all cases are perinatally acquired, an indication of the increasing levels of heterosexual HIV transmission in the region.

Th.G.P.28 INCREASING PROBLEM OF HETEROSEXUAALY ACQUIRED AIDS IN THE ENGLISH SPEAKING CARIBBEAN AND SURINAME.

Narain, Jai P;*Mahabir S;*Hospedales J;*Bassett D.*
*Caribbean Epidemiolgy Centre, Port-of-Spain, Trinidad.

Objective. To describe the changing epidemiolgy of AIDS in the Caribbean and it's implications for the control programme.

Methods. We analyzed data on AIDS reported by 18 English speaking Caribbean countries and Suriname to the Caribbean Epidemiolgy Centre as a part of PAHO regional Surveillance programme.

Results. As of September 30, 1988, 18 countries in the Caribean reported 914 cases of AIDS (only Montserrat is yet to report a case). Persons with AIDS, during early part of the epidemic, were primarily homosexual/bisexual men (55% of adult cases in 1985). Now heterosexually acquired (HT) cases are increasingly being reported (65% of all adult cases in 1988). Male to female ratio has declined from 5.4:1 up to 1985 to 2.2:1 in 1988. Trend in selectd countries as follows:

COUNTRY	1984		1986		1988	
	%HT*	M:F Ratio*	%HT	M:F	%HT	M:F
Trinidad	0	19:0	23	4.2:1	39	2.2:1
Bahamas	-	-	24	2.1:1	89	1.5:1
Bermuda	-	-	5	4.2:1	14	14:0
Jamaica	0	1:0	83	6:1	44	2.3:1
Barbados	-	2:0	30	3:1	42	2:1

*among all reported cases.

Conclusion. AIDS Education strategies have now been developed based on the changing epidemioigical situation in each country.

Th.G.P.29 MODIFICATION OF HIGH RISK HETEROSEXUAL BEHAVIOUR AFTER EDUCATION AND COUNSELLING IN NAIROBI

Cameron, D.W.; D'Costa, L.J.; Maingi, A.M.; J.O. Ndinya-Achola; Ronald, A.R. and Plummer, F.A.
Univ. Nairobi, Nairobi City Commission, Nairobi, Univ. Manitoba, Winnipeg.

Objectives. To evaluate the impact of education and counselling on sexual behaviour in men with prostitute-acquired sexually transmitted diseases (STD).

Method. 430 men with STD enrolled to a longitudinal study of HIV infection in Nairobi were informed and counselled about STD and HIV, with reinforcement at regular follow-up. Men were asked about past STD and habitual prostitute contact (HPC), follow-up prostitute (PROS) and regular partner (PART) sexual contacts, condom use and STDs were recorded.

Results. 28% of 293 HIV seronegative men followed-up 14 ± 16 (2-81) weeks reported prior habitual prostitute contact over one per month., and 12% had any subsequent prostitute contact. Over 50% had past and 19% had subsequent STD. Among men followed-up,

number	with HPC	had later PROS	or PART	contact with condoms.
93	≥1/mo.	13%	33%	30%
140	<1/mo	11%	31%	21%
74	once	9.5%	18%	18%

Conclusions. Established patterns of high risk heterosexual behaviour of men may be modified through education and counselling.

Th.G.P.30 TRANSMISSION OF HIV IN MANSA, ZAMBIA

Peter L. Perine*, Hira, S.K.**, Bhat, G.J.**, Mukelabai, K.**, Pearsall, N.N.**, Chishemba, C.***, et al.
*Uniformed Services University of the Health Sciences, Bethesda, Maryland, United States, **University Teaching Hospital, Lusaka, Zambia, ***Ministry of Health, Mansa, Zambia

We studied a community of 50,000 located in Northeastern Zambia where malaria is holoendemic. We tested 3,305 school children for antibody to HIV in 1985 as well as members of 233 randomly selected households. Eleven (0.33%) school children (4 males, 7 females) were WB confirmed seropositive for antibody to HIV. Most were anemic and underweight, had scarifications, and had a parent who was also HIV seropositive (7/11). All had received inoculations of vaccines and two had received transfusions. Among the 233 households, 40 (17.9%) had one or more seropositive members. Ninety-two (9.9%) of 925 persons in these households had antibody to HIV; 24 (6.9%) of 348 men ($\bar{x}$ age 35.1) and 68 (11.8%) of 577 women ($\bar{x}$ 26.1). Only 9 (2.5%) of 358 household children under 15 were infected (none between 4-11 yrs). Nineteen (8.5%) households had more then one HIV infected person, accounting for 62 (67.2%) of the 92 household cases. Heterosexual and perinatal transmission and transfusion appear to be the most likely modes of HIV transmission in this community despite frequent exposures to unsterile instruments used for scarification and daily exposure to mosquitoes.

CURRENT STATUS OF HIV INFECTION IN TAIWAN

Cheng-Hua Chuang, Department of Health, Taiwan, ROC

Objective. To control the transmission of AIDS, this study has been conducted to investigate the status of human immunodeficiency virus (HIV) infection in Taiwan.
Methods. A total of 706,246 serum samples from 9 risk groups of acquired immunodeficiency syndrome (AIDS) were tested for HIV antibody, using mainly enzyme-linked immunosorbent assay (ELISA) and Western blot.
Results. Among 1,184 homosexuals, 33 were positive (2.79%): 6 full-blown AIDS patients; 2 AIDS-related complex (ARC); 2 HIV encephalopathy; 4 persistent generalized lymphadenopathy (PGL); 19 asymptomatic carriers. Among 526 hemophiliacs, 40 were positive (7.6%), of whom two developed full-blown AIDS. One asymptomatic homosexual HIV carrier donated four bags of blood which resulted in a seropositive uremic patient. In general, antibody titers were higher in asymptomatic HIV-carriers, PGL and ARC than those detected in patients with full-blown AIDS.
Conclusion. The conclusion is that AIDS has invaded Taiwan, but the prevalence of the HIV infection is presently low. In the interim, active community efforts are needed to achieve future successs in AIDS control.

G.502

DEVELOPMENT OF AN HIV/AIDS SURVEILLANCE SYSTEM

Sax, Ronald; Cann, J. Department of Health, Bermuda Government, Hamilton, Bermuda.

Objective. To develop an accurate and comprehensive system of surveillance and follow-up for AIDS cases and HIV sero-positive tests.
Methods: Although Bermuda (approx. 57,000 population) is a small jurisdiction with a single acute care hospital and HIV testing facility, reporting of HIV/AIDS from physicians has not been complete. To ensure accurate surveillance, a detailed reporting scheme was developed based on regular communication between public health, hospital and laboratory staff. A computerized data base utilizing a personal computer and commercial spreadsheet software was developed to track all HIV sero-positive individuals and AIDS cases.
Results. Organization of the surveillance scheme has ensured that all diagnosed HIV/AIDS cases are reported to the Health Department for recording and follow-up. A Nurse Epidemiologist provides counseling for all newly diagnosed AIDS patients and pre- and post-HIV test counseling is provided by Health Department clinic staff. The accuracy of tracking and analysis has been improved through the development of the computerized HIV/AIDS data base.
Conclusions. A comprehensive surveillance system for HIV/AIDS can be developed utilizing currently available staff and resources by stressing effective communication between the public health department, acute care hospital and laboratory facility. A data base to provide accurate statistics for analysis and follow-up can be developed at low cost using proprietary software and a personal computer.

1. Kenya Medical Research Institute, P. O. Box 54840,
NAIROBI - Kenya

2. Ministry of Health,
P. O. Box 30016, NAIROBI - Kenya

Since 1984 when the first case of AIDS was reported in Kenya more than 3000 cases of AIDS have been diagnosed in this country. The M:F ratio is about 1:1 and the age distribution shows a bimodal characteristic with a small peak between ages 0 and 5 and a large peak between age 15 and 50. The commonest clinical presentation is weight loss, prolonged diarrhoea, chest infections, candidiasis and kaposis sarcoma. Recent surveys in selected large towns of Kenya have demonstrated high seroprevalence rates ranging from 12% to 24% among sexually promiscous women. Samples taken from sexually active and promiscous males in some of the towns have shown prevalences of about a third of the rate in corresponding females. Possible reasons for this distribution and implications for intervention measures will be discussed.

G.505

AIDS IN THE CONTEXT OF PRIMARY HEALTH STRATEGY.

Betts,Claude*;Carrington,Carmen*.
*Latin American Union Against STD's (U.L.A.C.E.T.S.)
U.S.A.

Objective. Demonstrate impact of the AIDS epidemic on primary health and community oraganization and participacion.
Methods. Trends of the AIDS epidemic are compared with governmental and nongovernmental responses in Latin America. Their impact on primary health and community organization is discussed.
Results. The AIDS epidemic is being characterized by successive waves of transmission among certain risk groups. Health authorities have been under pressure by the scientific community and the general public to implement strategies targeted at specific risk groups involved. Major efforts have been in health education, with emphasis put on: (1)disseminating "knowledge" about AIDS and (2)behavior modification. The crisis of health education strategies becomes evident when transmission begins to occur among relatively stable heterosexual populations. In these groups it is situations of risk (i.e. sexual exposure to an infected individual) rather than behaviors of risk that are major determining factors of AIDS transmission. Here, effective responses depend on (1)primary health system and (2)level of community organization and participation.
Conclusion. Responses to the AIDS epidemic have usually weakened already insuficient primary health resourses crucial not only for WHO's general health goals, but for the forthcoming waves of the AIDS epidemic.

G.506

GLOBAL SITUATION OF AIDS: AN ANALYSIS OF EPIDEMIOLOGICAL AND ECOLOGICAL ASPECTS

S.Shanmuganandan*, P.T.K.Subramanian**
*Dept.of Geography, Madurai Kamaraj University,Madurai-625002.
** Dept.of Medicine, Madurai Medical college, Madurai-625020,India.

AIDS emerged asa major general health problem generally refers to the last fatal stage of HIV infection. The ecological spectrum of Aids can be understood in five stages and the ecological changes associated with AIDS makes it difficult to identify since it constantly changes or modifies its outer coat alongwith genetic coding of the cells without making changes in its basic biology. The present study is an attempt to analyse epidemiological aspects with reference to spatial distribution and variation besides analysing its ecological trends. The epidemiological situation revealed that AIDS has already claimed 1,24,114 cases and in which North America has registered 71,343 cases followed by Europe with 12,414 cases. Of the total number of 58235 AIDS cases reported from 123 countries, 85% of the cases were from United States in September,1987. The analysis of AIDS cases reported by 6-month period from 1979 to 1987 revealed that 78% of the cases were from Americas followed by Europe (10.87%), Africa (9.43%), Oceania (1.05 %) and Asia (0.31%). It can also be expected that between 500,000 and 3 million new AIDS cases will emerge from persons already infected with HIV.
Statistical methods like ratio and percentage measures have been used to explain the ecological dimensions of AIDS in different countries and with this epidemiological situation is forecasted.

G.507

SERIAL SEROPREVALENCE STUDIES AND ESTIMATES OF INCIDENCE OF HIV-1 ANTIBODY IN PREGNANT WOMEN IN MALAWI.

Chiphangwi J. Liomba NG. Miotti P. Dallabetta G. Ndovi E. Alfred J. Saah.
The Queen Elizabeth Central Hospital. Blantyre. Malawi and The Johns Hopkins School of Hygiene and Public Health. Baltimore. MD. USA.

Objective. To determine the point prevalence of HIV-1 antibody and to estimate incidence of infection from prior prevalence studies.
Methods. 247 unselected consecutive women seeking care during December 1988 at the prenatal clinic of the QECH were studied for HIV-1 antibody status after informed consent. Sera were tested by ELISA; repeatedly reactive sera were confirmed by Western blot.
Results. 46 of the 247 (19%) were HIV-1 seropositive. From prior studies in Malawi, seroprevalence in the same population increased from 2% (4/200) in 1985 to 8% (7/85) in mid-1987 to its present level of 19% (46/247) in late 1988. It is possible to estimate that the incidence of seroconversion was approximately 3% to 4% per year during 1985-1987 and has increased to approximately 7% to 13% per year during 1987-1988 in pregnant women in Malawi.
Conclusion. HIV-1 infection continues to be epidemic in Central Africa and requires intensive and urgent intervention to reduce its high incidence.

G.509

EXPERIENCE IN PEDIATRIC GROUP (0-15y) IN A REFERENCE AND TRAINNING CENTER FOR AIDS.

Menezes,R.C.S.; Scapini,R.L.; Abboud,C.S.;Silva,C.L.; Pinto,W.P.
Centro de Referencia e Treinamento Aids-Secretaria da Saude Sao Paulo, Brazil

Objective.To verify age distribuition, risk factors and clinical presentation in 90 refered children to CRT Aids Sao Paulo-Brazil
Methods. 130 children were seen in a 10 month period (March to December,1988) at our Center, 90 of whom could be fully studied and comprise this paper. They were separated according to age in thefollowing groups: 1less than 15 m. o. ; 2. 15-36 m.o;3.3-6y.o 4. more than 6 y.o.
Results.Age distribuition were:28(31%)in group 1;24(26.6%)in group 2; 19(21%)in group 3;19(21%)in group 4.There were 10 symptomatic(class p2); 3 in group 1; 4 in group 2; and 3 in group 3. Only 2/ them died during during the follow-up period of 10 mo. Among the 90 children examinated,50 (50,7%) had drug addicted parents, 7 were themselves IV drug abusers; 6 had parental history of blood transfusion;4 had bissexual fathers;4 were adopted 3 were breast fed by infected women,3 were sexually abused.
Conclusion.These data support efforts toward education.

G.510

CHALLENGES AND ALTERNATIVES OF A NATIONAL PROGRAM OF AIDS. THE CASE OF MEXICO

Sepúlveda J*, Valdespino JL*, Garcia L*, Izazola JA*, Ornelas G*
*Directorate of Epidemiology, Ministryof Health. Mexico

Objectives: To analyze the challenges and alternatives for the design, execution and evaluation of the National Program for the Prevention of AIDS (NPA) in a Latinamerican country.
Methods: The NPA analysis was based on epidemiological patterns, behavioral studies, and on the evaluation of health institutions, communication media, and cultural and other sociodemographic patterns.
Results: From 1983 to January 1989, 2,013 AIDS cases have been notified in Mexico. The epidemiological pattern has intermediate characteristics between patterns 1 and II. Estimates of 30,000 to 100,000 HIV infected people have been made. The National Council for Prevention of AIDS initiated its activities in 1986. It is a multidisciplinary committee represented by government and non-governmental agencies. Mass media campaigns were developed to counteract myths and stigmas which have been decreased. Critiques to the educational campaign arose in some groups of the population. Centers for counselling and educational programs with active participation of groups with high risk practices have been created. In a short period of time a national network of laboratories for HIV detection was created which needs improvement of its quality control and coverage. The care of HIV infected people and AIDS patients is undertaken in specific services. It must be integrated to regular health services and health personnel must be trained. The commercialization of blood has been prohibited, the detection of blood donors is mandatory; legal problems exist regarding prostitution and ethical problems have appeared regarding discrimination of HIV infected. The need of care for AIDS patients creates problems because of costs, hospital beds availability and socioeconomical repercussion.
Conclusions: The design, execution and evaluation of the NPA in a Latinamerican country as Mexico has involved challenges and alternatives according to the context and infrastructure of this country.

G.511

FAIBLE PREVALENCE DES ANTICORPS ANTI-VIH EN ZONE RURALE AU CONGO.

Pierre M'PELE*, J.C. LOUKAKA*, M. COPIN*, M. ROSENHEIM**, A. ITOUA-NGAPORO*, M. GENTILINI** - *Comité National de Lutte contre le SIDA, Congo. **Dpt de Médecine Tropicale, Hôpital de la Salpêtrière, Paris, France.

Le Congo est un pays d'Afrique Centrale où sévit une épidémie de SIDA (1250 cas déclarés). La séroprévalence des anticorps anti-VIH chez les donneurs de sang des 2 grandes villes du pays (Brazzaville et Pointe-Noire) se situe entre 4 et 6%. Nous avons étudié de façon exhaustive la population de 5 villages situés dans différentes zones du pays. Des travaux antérieurs ayant montré que la probabilité pour qu'un sérum soit positif en Western blot lorsque sa densité optique en ELISA (ELAVIA, Diagnostics Pasteur) est inférieure à 1, est très faible, nous n'avons retenu comme positifs que les sérums dont la DO était supérieure à ce seuil.
526 sérums ont été étudiés et 5 ont été trouvés positifs, soit 0.95% +/- 0.83. Dans un village, aucun sérum n'était positif.
Cette faible séroprévalence en zone rurale doit inciter à y renforcer les campagnes de prévention afin d'éviter une extension de l'épidémie des villes vers les campagnes.

G.512

SEROPREVALENCE OF H.I.V. INFECTION IN BOLIVIA

MELGAR M L*, NAVARRO F*, MARISCAL J*, ANDRADE ARZABE R**, PACHECO MA**, LAFUENTE C***.
* AIDS PROGRAM EPIDEMIOLOGY DIV. MINISTRY OF HEALTH BOLIVIA.
** IMMUNOLOGY LAB. INLASA MINISTRY OF HEALTH BOLIVIA
*** CENETROP SANTA CRUZ MINISTRY OF HEALTH BOLIVIA

OBJETIVE.- Seroprevalence survey in differents groups of bolivian people in active sexual age.
METHODS.- We tested 5325 individuals for H.I.V. antibody and seropositivity confirmed by Indirect Immunofluorescence and Western blot, from March '88 to December '88. These individuals belong to the following groups: females prostitutes, prisoners, homosexual and bisexual men, blood transfused donors, intravenous drug abusers, prenatal control, military recruitment, spontaneous demand and university students.
RESULTS.- The seropositivity for HIV infection and the distribution is shown in the next table:

GROUPS	SAMPLES	%	H.I.V. +
1.- Prisoners	1,579	29.5	2
2.- Females prostitutes	1,094	21.0	0
3.- Homo/bisexual men	68	1.3	7
4.- Blood donors	1,255	23.6	1
5.- Intravenous drugs abusers	42	0.08	0
6.- Prenatal control	372	7.1	0
7.- Military recruitment	150	2.9	0
8.- University students	300	5.7	0
9.- Spontaneous demand	425	8.1	0
total	5,325	100.0	10

CONCLUSIONS.- The seropositivity was in the homo/bisexual group, prisoners and one in the blood donors others groups studied were negative, we conclude the seroprevalence in Bolivia is low yet.

G.513 The Constitution of the Organisation of the African Union-OAU and AIDS

B.A.N.N. MAFAMA*
* Chargé de Laboratoires, BCC-SIDA, ZR. Zaire.

The African struggle against AIDS means fundamentally :
" Improve the living conditions of the Africans".

The improvement phase of the African standard of living may only be attained by the advent of a system of democratic plurality, appropriate to the mentality of the People of this Continent.

A democracy for Africa, a Continent which is essentially underdeveloped, is only possible in framework of the PanAfrican National Congress-PANC-
- which is the social-judicial manifestation of the organization of the African Union-OAU-,
- and which contains four popular power branches :
  1. the PanAfrican Legislative Council.;
  2. the Community Financial Audit.;
  3. the Constitutional Community Court.;
  4. the PanAfrican Executive Council.

G.514 IMPACT OF COMPUTER SCIENCE ON AIDS RESEARCH

Clavreul, Genevieve, **World Immunological Network Project Foundation**, Los Angeles, CA USA

OBJECTIVE To demonstrate the effort of laser and computer transmitted data on the dissemination of AIDS information among researchers and practitioners on the international level. **METHODS** Using Laser Disk and AIDS Stack technology, and international data bank utilizing Diversified Network Applications (DNA) on AIDS research and treatment has been created for use by researchers and clinicians worldwide. **RESULTS** The Laser Disk and AIDS Stack methods of data collection increase the speed, timeliness and availability of the latest information on AIDS, avoiding duplication of efforts, fragmentation of locale and unnecessary expenditure of scare resources. **CONCLUSION** There is a demonstrated need for centralizing information on AIDS to develop a cohesive, easily accessible body of data that is readily updated and revised. The computerized network of information enables researchers and clinicians to track epidemiological trends, exchange ideas on treatment protocol and document research results. The databank also has applications in the educational arena where universities, clinics and nonprofit groups are involved in teaching the community about AIDS.

G.515 EPIDEMIOLOGICAL FINDINGS OF HIV INFECTION AMONG WOMEN FROM SAO PAULO-BRAZIL.

FERREIRA A[1];Grandi[2] J;Fernandes M[2];Acceturi C[1];Pinto W[2]
1.Paulista School of Medicine-Infections Diseases Unit.São Paulo.
2.Reference Center for AIDS. Out-patient care Unit.SP.Brazil.

Objective:To evaluate the extension of HIV infection of women in São Paulo state.
Methods:Among the women(10years old)registered in two out-patient care Units from Jan 84 to Jan89 a sample of 611 were studied.The test used was ELISA and confirmed by W.L.techniche.The seroprevalence of HIV infection among the sexual partners,IV drug abusers and blood transfusion receipts was determined.Others epidemiological aspects will be analyzed.
Results:Seroprevalence of HIV antibody in those groups

	HIV POS		HIV NEG		TOTAL
Sexual Partner	81	33%	163	67%	244
IV drug abusers	75	74%	25	26%	102
Blood receptors	22	48%	23	52%	45
Indetermined	20				20
Total	199		212		411

Conclusion: Many epidemiological aspects of HIV infection in women will be enphasized in this study. One of the most important is that among the IV drug abusers the seroprevalence was higher than in the sexual partners (33%)

G.516 PREVALENCE OF POSTMORTEM ANTI HIV ANTIBODIES IN THE STATE OF JALISCO, MEXICO..

Vázquez-Valls, Eduardo*; Torres-Mendoza, B.*; Vázquez-Rizo, -J.*; Rivas-Souza, M.** and Valencia-Gutiérrez, N.**
*Instituto de Patología Infecciosa y Experimental "Dr. Fco. Ruiz Sánchez" de la Universidad de Guadalajara, Jalisco, México. **Departamento de Medicina Forense, Procuraduría General de Justicia del Estado de Jalisco, México.

Objective. To know the prevalence of postmortem anti HIV antibodies in corpse of unknown origin in the state of Jalisco, México, and to determine the risk factor for health workers that are in contact with them.
Methods. Randomized samples of 97 corpses of unknown origin were taken from 2595 necropsies, during the year of 1988. At the beginning of each necropsy a sample of 5 cc of blood was taken from the thoracic cavity, to which ELISA assay was practiced, and confirmed by indirect immunofluorescence assay (IFA) and/or Western Blot (WB).
Results. The seropositivity obtained and corroborated by IFA and/or WB assay in this study, was 1.03% (one case), that belonged to a 30 years old male corpse, apparently from the USA, his death cause was medical intoxication, and in the necropsy there was also data of homosexuality. The health workers risk factor in Guadalajara, from being in contact with corpses of unknown origin HIV positive, is 1.03% and it increases to 25% with foreingners.
Conclusion. In our country the prevention rules should be increased in health workers in contact with corps of unknown origin specially with foreingners, and probably with homosexuals.

G.517 VERTICAL TRANSMISSION OF HIV-2; LACK OF EVIDENCE

Kvinesdal, Birgit Bak*; Hejlyng, N.*; Molbak, K.* and Aaby, P.**
*Statens Seruminstitut, Copenhagen, Denmark, **University of Copenhagen, Copenhagen, Denmark.

Objective. To investigate the occurrence of vertical transmission of HIV-2.
Material and Methods. In a 2-year longitudinal cross-sectional community study from Guinea-Bissau based to investigate the epidemiology of cryptosporidiosis in children and their families, 113 mothers and their 143 children less than one year of age were tested for HIV-2 antibodies in order to elucidate the frequency of vertical transmission. Blood samples were tested for HIV-2 antibodies by indirect ELISA; positive results were confirmed by WB.
Results. Of the 113 mothers, 11 were found to be HIV-2 antibody positive. Two of the eleven children born of positive mothers were found to be HIV-2 positive. One was tested positive at 3 1/2 months of age and was lost to follow-up. The other was positive at 5 months but turned negative at 8 months of age. The remaining 9 children were repeatedly negative. No children born of HIV-2 negative mothers were found to be HIV-2 positive.
Conclusion. Vertical transmission of HIV-2 in Guinea-Bissau seems rare. Maternal antibodies apparently disappear before 8 moths of age.

G.518 HIV-1 ANTIBODIES IN BRAZILIAN PRISONERS

Cracina, Antonio; Peixinho, Z.; Hernandez, H.; Lacouture, C.; Longo, I. and Mendes, N..
Escola Paulista de Medicina, São Paulo, Brazil.

Objective. To determine the HIV-1 infection prevalence among male Brazilian prisoners.
Methods. The presence of HIV-1 antibodies was investigated in serum samples from 923 volunteers from a prison located at the inner-city area of São Paulo, obtained during Abril and May, 1988. They were clinically well at the time of blood collection. The serum samples were analysed by indirect ELISA tests using: whole-virus preparation (VIRGO™ HIV-1 ELISA,Electro-Nucleonics), recombinant viral proteins (HB K405, Embrabio) and the synthetic peptide LGIWGCSGKLIC corresponding to a segment of gp41 (research test kit, Escola Paulista de Medicina).
Results. By using the three distinct serological methods, the prevalence of HIV-1 antibodies was 12.56% (116/923). This result may reflect the minimum HIV-1 infection prevalence among the individuals within that prison, since some prisoners with risk factors denied to enroll in the study. False positive reactions due to antibodies to H9 cell line proteins were not observed.
Conclusion. The high prevalence of HIV-1 infection among Brazilian prisoners, as occurs in other countries, is mostly due to homosexual and drug-sharing exposures.

G.519

ABSENCE OF HIV-1 AND HIV-2 INFECTION IN AFRICAN TRIBES, 1968-72

Schindzielorz, Andrew; Belshe, R.; Read, J. and Mufson, M.
Marshall University, Huntington, WV, U.S.A.

Objective. To examine sera for HIV-1 and HIV-2 antibodies collected in Africa in the Pre-AIDS era.
Methods. 159 sera from Africa were collected as part of a respiratory epidemiological study from 3 tribes: 60 Mano (Liberia); 84 Korekore (Zimbabwe); and 15 Turkana (Kenya). These sera were tested for HIV-1 (Abbott HIV-1 EIA, Biotech/DuPont HIV-1 Western blot (WB) and HIV-2 (DuPont HIV-2 WB) antibodies.
Results. Number Positive or Indeterminant (I) / Number Tested (%)

	HIV-1			HIV-2	
Tribe	+EIA	IWB	+WB	IWB	+WB
Turkana	9/15 (60)	11/15 (73)	0/15	5/10 (50)	0/10
Mano	41/60 (68)	46/60 (77)	0/60	33/53 (62)	0/53
Korekore	56/84 (67)	33/83 (40)	0/83	15/45 (33)	0/45
Total	106/159 (66)	90/158 (57)	0/108	53/108 (49)	0/108

The frequency of positive EIA increased with age but indeterminant Western blot (IWB) to HIV-1 or 2 did not increase with age. The most common bands detected by HIV-1 WB were p24, (28%) and p17(29%). HIV-2 WB detected bands to p66 (41%) and GP41(14%) but infrequently to p24 (<1%).
Conclusion. No HIV-1 or HIV-2 infected persons were found in this retrospective study. Significant differences in patterns of HIV-1 and HIV-2 IWB occurred.

G.520

HIV INFECTION AMONG DUTCH EXPATRIATES WORKING IN AFRICA

Houweling, Hans*; Van den Akker, R.*; De Grave, A.; Smits, S.P. Ligthelm, R.J.; Leentvaar, A.; et al.
* National Institute of Public Health (RIVM), Bilthoven, The Netherlands.

Objective. To study the prevalence of HIV infection and related risk factors among Dutch expatriates working in sub-Saharan Africa.
Methods. In the course of a routine medical check expatriates who have been posted in sub-Saharan Africa for at least 6 months since 1978 are asked to give a vial of blood and to complete a self-administered questionaire on sexual, occupational and other risk factors for HIV infection.
Results. Among 1230 participants posted in 39 African countries (Sept.1987-Dec. 1988) Western risk factors were relatively rare: 18 men (2.6%) were homo/bisexual, 2 men and 1 woman had used i.v.drugs. However, 71 men (10.2%) and 20 women (3.8%) had been treated for S.T.D. Risk factors in Africa included sex with African partners (37% of men, 15% of women: mean 5, range 1-150). Condom use was infrequent and inconsistent. The majority of medical doctors (81%) and midwifes (69%) and 32% of nurses had suffered needle stick accidents (mean 15, range 1-150). Four participants were found to be infected (seroprevalence : 0.3%, 95%C.I. 0.01-0.7%), 2 men and 2 women: 1 woman had sex with a bisexual men, all 4 had sex with African partners and had been treated for S.T.D., 1 had an African partner and 1 was born in Africa, no one had occupational exposure to HIV.
Conclusion. Despite high prevalence of risk factors HIV infection is rare among a non-selected group of expatriates working in sub-Saharan Africa.

G.521

TRANSMISSION OF HIV INFECTION THROUGH BREAST MILK

Suniti Solomon*; Sridhar, N.*; Sundararaman, S.*; Arulraj, A.*; S. P. Thiagarajan.**
* Madras medical College, Madras, India. ** Post Graduate Institute of Basic Medical Sciences, Madras, India

Objective. Can breast feeding transmit HIV infection from HIV seroreactive mothers to their children?
Methods. With a view to assess the possibility of perinatal transmission of HIV infection from seroreactive mothers to children besides vertical transmission, 19 HIV seroreactive prostitutes (both by ELISA and Western Blot) and their children were analysed. Group A mothers (2) were asked not to breast feed their children and the latter remained seronegative till 10 months of follow up. Group B mothers (3) who could not be stopped from breast feeding their children tranamitted HIV infection as evidenced by appearance of HIV antibodies in them by 6th, 7th and 8th month after birth. Group C mothers (14) who had breast fed all their children could be analysed only retrospectively. They revealed interesting patterns. The details would be presented.

Conclusion. The high rate of HIV transmission through breast feeding is highlighted.

SECTION H

M.H.0.5 COST-EFFECTIVENESS OF HIV SCREENING AMONG PREGNANT WOMEN IN PARIS HOSPITALS

Le Galès Catherine (1), Moatti J.P. (1), Collectif Paris-Tours d'Etude de la transmission HIV périnatale (Paris Tours Study Group on Perinatal Transmission HIV)
(1) INSERM U240, Paris, France

An epidemiologic multicentric study (coordinated by "Centre d'Hémobiologie Périnatale", Paris and Service de Virologie, Hôpital Bretonneau, Tours) about perinatal transmission of HIV is currently carried out in Paris region. In that context, between August 1987 and February 1988, HIV screening was systematically proposed to all pregnant women attending to 9 obstetrical clinics in the region (n=7,800). 2,140 have already been tested for HIV and 45 were known HIV+. Among the 5,660 tests of pregnant women who have never been screened, 18 were discovered HIV+ (Total prevalence : 6,95 10^{-3}). Under the assumptions of ELISA sensibility (98.5 - 99.5%) and specificity (98.3 - 99.7%) the *average cost per additionnal pregnant woman HIV+ discovered in clinics varies from $ 6,460 to 6,950.*

As women, before being screened, had to answer a questionnaire about risk factors, non-systematic screening based on such factors can be simulated. In this case, only 12,5% of pregnant women would have been tested, the total prevalence would have been 5,4% and the average cost per HIV+ discovered $ 1,300. With regards to the 3 additionnal HIV+ pregnant women discovered by systematic screening (compared to non-systematic one), the *cost per supplementary HIV+ woman found (marginal cost) is $ 33,500.*
For the next 6 months of the screening program (February - August 1988, n = 7,750), similar calculations lead to an average cost of $ 26,600 - 28,800 for systematic screening (4 pregnant women discovered HIV+) ; and of $ 8,000 for non-systematic screening (15% of at-risk population, total prevalence 7%).

Results suggest that *cost effectiveness of HIV screening among pregnant women in hospitals is, in fact, highly depending of diffusion of screening practices in other sectors of prenatal care* especially ambulatory medicine (between August 1987 and 1988, the % of women already tested before attending obstetrical clinics raised from 22 to 32%).

M.H.0.2 COST OF MEDIUM-TERM AIDS PREVENTION AND CONTROL PROGRAMMES IN SUB-SAHARAN AFRICA

Drager, Nick*; Collis, L.**; Tarantola, D.*; Lamboray, J.L.**; Camen, U.***; Phillips, M.****, et al.
*World Health Organization, Geneva, Switzerland, **World Bank, Washington, DC, USA, ***University of Geneva, Geneva, Switzerland, ****London School of Hygiene and Tropical Medicine, London, UK.

The globally agreed strategy for AIDS prevention and control calls for the formulation of comprehensive medium-term plans which describe the policies, strategies and activities around which government, non-governmental and international agencies will focus their collaboration. Governments and the international community need to know the level of resources required to implement these plans. As very litte published data exists on the real costs of implementing AIDS programmes, a study was made by the World Health Organization and the World Bank of budgeted costs of 12 medium-term programmes formulated in Sub-Saharan Africa.

The study initially described the main features of the first year budgets and then explored the relationship between costs and several country characteristics with the intention of using this both to predict likely future costs and to extrapolate costs to other countries in the region. This paper provides a discussion of the rationale, the methodology and the results of the study. It points to the need to develop uniform costing guidelines, to collect retrospective expenditure data and to undertake preliminary cost-effectiveness analyses of elements of the plan.

M.H.0.4 HIV SCREENING AMONG POTENTIAL IMMIGRANTS: A COST/BENEFIT ANALYSIS

Hanna Zowall*, N Gilmore*, RD Fraser**, A Deutsch*, SA Grover*. *McGill University, Montreal, Quebec, Canada, **Queen's University, Kingston, Ontario, Canada.

Objective. To assess the economic impact of HIV screening among potential immigrants to Canada on the national health care system and Canadian community.
Method. We developed an economic model based on current international HIV seroprevalence data, Canadian immigration statistics, disease progression estimates and the projected costs of HIV screening and treating AIDS patients.
Results. Estimating that 139,034 immigrants enter Canada in 1988, between 269 and 671 are likely to be HIV carriers. Screening would lead to the exclusion of between 284 and 686 persons including false positive results. The estimated total cost of screening every immigrant ranges between $1.7 million and $4.0 million. The present value (discounted at 7.5 percent) of the medical costs for 48 percent of the HIV carriers who will develop AIDS between 1988 and 1997, ranges between $6.5 million and $21.0 million. However, the limited net benefit associated with screening may be significantly offset by additional administrative costs to immigration, loss of desirable applicants, and forgone income.
Conclusion. The cost/benefit of HIV screening for potential immigrants remains uncertain given the associated costs which have not yet been determined.

M.H.0.6 THE ROLE OF COMMUNITY-BASED ORGANIZATIONS IN CONTAINING THE COSTS OF THE AIDS EPIDEMIC

Smith, Mark D., University of Pennsylvania, Philadelphia, PA USA

National AIDS efforts have 3 general components: prevention , health and social services, and creation of a supportive social environment. All three areas require substantial and rapidly-growing financial outlays.
Community-based AIDS service organizations (CBOs), including organizations of Persons With AIDS, have been in the forefront of education and service delivery in the U. S. One study estimated the value of volunteer services by one CBO in New York at over 2 million dollars for 1987 alone. A number of areas of work can benefit economically from CBO efforts:

AREA	MECHANISM OF COST REDUCTION
Medical services	Early discharge, home support
Education	Training of volunteers
Clinical trials	Publicity, recruitment, retention
Social disputes	Community education, dispute mediation
Prevention	Community education to reduce HIV transmission

CBOs depend on relatively fragile government and private support, and their volunteers face fatigue and burnout. In addition, the changing face of the epidemic in the U.S.- particularly the rise in the numbers of minorities and drug-users with AIDS - may make it more difficult to rely on unpaid volunteers. Support for the CBOs themselves is arguably a cost-effective investment for hard-pressed public agencies.

Hospital Based Costs

M.H.O.7

HOSPITAL CARE FOR AIDS PATIENTS: CLINICAL PROBLEMS AND ASSOCIATED DAILY COSTS.

Steven A Grover*, N Gilmore**, J Falutz*, C Tsoukas*, L Coupal*, R Fakhry*. *Montreal General and **Royal Victoria Hospitals, McGill University, Montreal, PQ.CANADA

Admissions for AIDS patients are believed to pose a major economic burden to hospitals. However, aggregating the costs of specific admissions may be misleading given the diverse indications such as pneumocystis pneumonia (PCP), other opportunistic infections (OI), Kaposis Sarcoma (KS), neurologic problems (CNS), experimental treatments (ET), and other problems (OP). To estimate the cost of specific admissions, we evaluated daily costs at the Montreal General Hospital for AIDS between 1981-86 (84 admissions, 44 patients). Utilization and primary diagnosis were determined by chart review and unit costs for services were estimated by step-down costing (simultaneous allocation method). Average length of stay was 25.7 days and average total admission cost was $11,058. Mean daily cost was $453, with much variation (SD ± 157) due to primary discharge diagnosis and in-hospital death (IHD) ($p's<0.05$).

Primary Diagnosis			PCP	OI	CNS	KS	ET	OP
IHD	Yes	Daily Cost	$766	$444	$530	$349	—	$545
		(Admissions)	(5)	(7)	(3)	(1)	(0)	(2)
	No	Daily Cost	$385	$406	$464	$463	$496	$412
		(Admissions)	(14)	(19)	(5)	(9)	(8)	(11)

Conclusion. Specific AIDS admission costs vary greatly and estimates based on aggregated averages may be inaccurate. Primary diagnosis and IHD should be considered when projecting the costs of AIDS hospitalizations.

M.H.O.9

LONGITUDINAL HOSPITAL USE AND CHARGES OF SCATTER BED AND AIDS CLUSTER UNIT INPATIENTS

Fahs, Marianne*; Strain,J.*; Fulop,G.*; Sacks,H.*; Padgug,R.**; Eisenhandler,J.**. *Mount Sinai Medical Center, NY,NY, **Empire Blue Cross and Blue Shield, NY, NY. U.S.A.

Objective. A vital policy issue today is the most effective way of caring for seriously ill AIDS patients. The objective of this study is to compare two AIDS inpatient care modalities, cluster units vs. scatter beds, in Mount Sinai Medical Center, NY, NY.

Methods. This retrospective evaluation tracks all hospitalizations for AIDS patients over the course of illness. It assesses a unique cohort of patients who have received 2 different modalities of inpatient treatment with regard to sociodemographic data (age, sex, risk-group, and insurance status); diagnosis and severity of illness; resources consumed during hospitalization (length of stay, staff hours, ancillary procedures, and cost/charges); and total hospital use across settings (admissions x length of stay), using a merged data set from Blue Cross and Mount Sinai for 1987 and 1988.

Results. Results indicate a significant ($p<.05$) increase in length of stay for cluster unit patients (21.9±18.0 vs. 14.7±12.8). The results of cross-sectional multivariate analyses, controlling for differences in patient mix, severity, discharge status, and pooled with longitudinal descriptions of pre- and post-AIDS diagnosis hospital use and charges are also presented.

Conclusion. This study offers new indicators of cost and quality differences by hospital setting for AIDS patients. In particular, this study presents utilization differences over the entire episode of treatment. The methodology may be of use to planners world-wide as treatment and financing initiatives are evaluated in other settings.

M.H.O.11

NEW YORK MEDICAID AIDS PATIENTS: TRENDS IN HOSPITAL USE AND MORTALITY RATES

Turner, Barbara*; Fanning, T.**; Keyes, M.*** and Markson, L.* *Jefferson Medical College, Philadelphia, PA, **Dept. of Social Services, Albany, N.Y., ***SysteMetrics, Washington, D.C.U.S.A.

Objective. To determine trends in mortality rates and hospital use for clinically comparable groups of N.Y. Medicaid AIDS patients.

Methods. All hospital discharges of Medicaid AIDS patients in 1985-87 in N.Y. have been identified through a search of claims data. A severity classification using ICD-9-CM codes in discharge abstracts grouped patients into 20 substages that are ordered by risk of inpatient mortality. Trends in health care resource use are analyzed.

Results. Over 16,000 Medicaid AIDS patients' hospital discharges were staged. Eighty percent of the AIDS discharges were aged 20 to 44 years, 66 percent were male, and 15 percent could be definitely identified as IV drug abusers. The number of discharges increased from 3580 in 1985 to 7903 in 1987. The average lengths of stay for 1985-87 were 20.5, 19.3, and 21.2 days respectively, but substantial variation was found by month. A January hospital stay was found to be 40% longer than a stay in June of the same year. Lengths of stay for each year formed a sine wave curve with peaks in winter months and troughs in summer months. Staging is being applied to these data to determine if, as in other diseases, patients experience greater morbidity from infections, either opportunistic or non-opportunistic, in the winter.

Conclusion. Marked monthly variation in lengths of hospital stay was found in N.Y. Medicaid AIDS discharges. Applying a severity classification to a large set of AIDS discharges over a three year time period will help inform clinicians of the range and outcome of conditions seen in AIDS patients hospitalized in N.Y. and will help policymakers plan for levels of hospital resource use.

M.H.O.8

PEDIATRIC HIV-RELATED DISCHARGES IN A SAMPLE OF U.S. HOSPITALS: DEMOGRAPHICS, DIAGNOSES, AND RESOURCE USE

Susan Thaul, Ph.D. and Judy K. Ball, Ph.D.
National Center for Health Services Research, USDHHS, Rockville, MD, USA

Objective. This paper describes the characteristics of and care provided to children with HIV-related diagnoses in acute-care general hospitals.

Methods. The analysis is based on pediatric discharges with HIV-related diagnoses in the Hospital Cost and Utilization Project (HCUP) data base for 1986 and 1987. HCUP is a national sample of 400+ hospitals. Thus, it oversamples admissions in areas with low incidence of HIV infection and reflects the range of demographic and clinical characteristics among children with AIDS, ARC, and HIV seropositivity.

Results. The analysis describes diagnoses, procedures, and resource use in relation to demographic, geographic, and hospital characteristics. Preliminary analyses suggest differences between pediatric and adult HIV-related hospitalizations. Pediatric cases have longer lengths of stay (16.4 vs. 13.6 days), nearly double the charge per stay ($21,434 vs. $11,016), and higher charges per day ($1231 vs. $1100). Medicaid was reported as primary expected source of payment for 47% of pediatric HIV discharges, with private insurance accounting for another 37%. Compared to discharges for all diagnoses, pediatric HIV patients are disproportionately black (15.3%) and hispanic (8.3%). However, the sex-distribution for pediatric AIDS is nearly identical to that of all other pediatric cases.

Conclusions. Pediatric HIV-related hospitalizations differ in important ways from both adult HIV and other pediatric discharges. Understanding these differences will help in planning prevention and treatment services.

M.H.O.10

THE $147,000 MISUNDERSTANDING: OVERSTATING THE COST OF AIDS

Jesse Green*, G. Oppenheimer**, M. Leigh*
*NYU Med. Ctr., NY, NY, USA, **Brooklyn Col., Bklyn, NY, USA

Objective. We explain why the first published economic impact study of AIDS overstated medical costs by 2 to 3 times and trace its policy consequences.

Methods. Critical literature review, analysis of published data, interviews.

Results. During the early years the HIV epidemic appeared to overwhelm the U.S. biomedical and health care systems. With this crisis atmosphere as background researchers at CDC produced the first published study of lifetime AIDS treatment costs with an extraordinarily high estimate of $147,000 per case. It was nearly a year before much lower estimates in the $40-50,000 range were published.

Some analysts have recently tried to account for the very high CDC estimate as reflecting treatment patterns early in the epidemic or the high cost of AIDS in NYC municipal hospitals, but in fact the study overestimated the cost of AIDS because the methodology was seriously flawed. It was based on data which were inadequate for a cost estimate and made assumptions which tended to inflate the overall result. Our analysis of data from NYC for the same period indicates that patients whose total hospital stays were estimated by CDC to average 168 days actually averaged 75-80. This difference alone would have cut the CDC figure in half.

Nevertheless, the CDC study is still widely cited in the literature as the upper limit of AIDS lifetime costs. Viewed as the "early" cost of AIDS it led to spurious hypotheses about why costs declined; viewed as the high cost of NYC hospitals it fueled the drive to reduce these costs to supposedly much lower San Francisco levels. Insurers used the $147,000 figure to forestall the banning of antibody testing, to attempt to shift the costs of AIDS patients to the public sector, to argue in favor of state risk pools, and to sell cost-management programs to employers. There is evidence that insurers and their trade organizations continued to cite the CDC cost estimate to their benefit even once they knew the estimate to be inaccurate.

Conclusion. A prominent and widely disseminated CDC study in 1986 greatly overstated AIDS costs because of methodological problems. Misunderstandings about the financial impact of AIDS resulted, which influenced policy and still persist. There is no evidence that AIDS patients anywhere in the U.S. ever averaged 168 hospital days or cost $147,000.

M.H.O.12

UN SYSTEME D'INFORMATION HOSPITALIER POUR LES INFECTIONS PAR LE VIH

BOULAY Fabrice, SALIN J., BUCHET P., PETIT F., LOGEROT H., BEZ G.*
Direction des Hôpitaux. Ministère de la Santé. Paris. France

L'épidémie frappe inégalement les différentes régions françaises alors que les budgets hospitaliers progressent annuellement selon un taux directeur national. Il est alors indispensable d'évaluer l'activité médicale et les coûts hospitaliers du VIH par un système d'information (SI). En l'absence de SI hospitalier intégré, un SI particulier au VIH a été élaboré pour les centres de référence VIH. Le résumé de sortie standardisé (non obligatoire en Fr) accompagné d'une fiche de consommations standardisée (actes, médicaments et produits sanguins en qualité et quantité) est relevé pour chaque hospitalisation ou hôpital de jour VIH sous numéro anonyme et responsabilité médicale après information et consentement des malades. Le nombre de lymphocytes T4, l'inclusion à un protocole épidémiologique ou thérapeutique et la notion de première hospitalisation pour le même diagnostic, informent sur la sévérité du cas et les conditions de prise en charge. Une classification diagnostique de type CIM-9, des thésaurus d'actes et de thérapeutiques ainsi que des règles de codage ont été définis. Des techniciens ont été spécialement formés à ce SI. Un logiciel de recueil, d'échange, de gestion et d'analyse statistique et financière des données a été distribué sur micro-ordinateur PC-AT.

Décidé fin 1987, ce SI est opérationnel depuis juin 1988. A présent installé dans 19 des 23 centres de références, 4336 dossiers médico-économiques ont pu être collectés dans une base de données nationale. L'évaluation de ce SI est en cours et il est déjà possible de connaître l'utilisation des structures de soins (près de 50 % de séjours d'un jour pour bilan ou suivi de sujets peu ou pas asymptomatiques), les différents processus de soins (amenant les responsables médicaux à diffuser des recommandations), la formation des coûts hospitaliers (durées de séjour, coût de l'interféron...) et les coûts des différentes pathologies VIH. Ce SI devra s'étendre aux activités ambulatoires.

En plus de ses applications nationales dans le financement et la planification des soins, ce SI apparaît aux hôpitaux indispensable à l'évaluation médico-économique de ses nouvelles activités.

M.H.0.13 MEDICAL COST OF HIV INFECTION OF PATIENTS FOLLOWED IN GENERAL PRACTICE IN FRANCE

Massari Véronique*, Landman R.**, Fagnani F.***, A-J. Valleron*
* INSERM U263, Université Paris 7, París, France, ** Service des Maladies Infectieuses, Hôpital Bichat, Paris, France, *** INSERM U240, Paris, France

Objectives: To estimate number of HIV patients followed by general practitioners.and the cost of their medical care
Methods: A questionnaire was mailed to all sentinel GPs (n=500) of the French Communicable Diseases Network (1% sample, representative of French GPs). The components of the questionnaire were : number of new HIV seropositive patients in 1987; number of HIV positive asymptomatic patients followed; number of consultations and type of biologic and clinic examinations. The mean cost by year and by patient is estimated as the mean sum of medical visits and biologic examinations.
Results: The response rate was 78%. 29% of respondents were caring for one or more infected patients. The mean number of HIV patients per GP was 1.2 corresponding to an estimation of 69 000 ± 3 000 cases, (mean ± sd) for France as a whole. The mean number of HIV patients screened in 1987 by GPs was 0.51 corresponding to 30 000 ± 2 000 cases for France. The mean number of HIV patients followed regularly by GPs was 0.84 corresponding to an estimation of 48 000 ± 2 500 cases for France.
Two thirds of HIV patients were regular patients of GPs. Each patient was seen 3.6 times per year. Those biologic examinations regularly prescribed were blood count, T4/T8 ratios, lymphocytes, thrombocytes counts and, HBs antigene, and HIV antigene detection.
Mean cost for first visit was 523 ± 18 FF (mean ± sd) and 446 ± 36 FF for other examinations. The total, the mean cost by patient by year have been estimated at 2 288 ± 251 FF.
(1FF = 0.17 US$ or 0.20 C $)

M.H.0.14 TRENDS IN UTILIZATION AND COST OF TREATING AIDS IN AN HMO

Coltin, Kathryn; Goldberg, J.; Kuvin, L.
Harvard Community Health Plan, Boston, MA USA

Objective. To measure trends in utilization and cost for HMO members who died of AIDS, and to assess the effects of creating a new, centralized AIDS consultative team on efforts to substitute outpatient for inpatient services. This "enhanced" primary care model was established in April 1986.
Methods. Outpatient and inpatient records were analyzed for 93 consecutive deaths among HMO members dying of AIDS during fiscal years 1985 through 1988 (Oct.'84 - Sep.'88). These cases were divided into six cohorts based on date of death (FY85, FY86, 1sthalfFY87, 2ndhalfFY87, 1sthalfFY88, and 2ndhalfFY88). Mean survival rates were calculated for each cohort, in addition to mean outpatient visit rates, inpatient admissions, hospital days and out-of-Plan costs per patient and per patient month of life.
Results. Mean survival increased from 6.6 months for the FY85 cohort to 12.6 months for the 1sthalfFY87 cohort, the 1st cohort to receive all of their care under the new model. It then held steady over 3 cohorts, before increasing to 18.1 months for the 2ndhalfFY88 cohort. Lifetime outpatient visit rates increased over 280% between FY85 & 2ndhalfFY88, from 35.3/pt to 135/pt. Lifetime hospital admissions, hospital days and out-of-Plan costs increased from the FY85 through the 1sthalfFY87 cohorts, declined or held steady over the next 2 cohorts, and increased markedly in the 2ndhalfFY88 cohort, reflecting survival trends. Hospital admissions per patient-month increased slightly over the 1st 3 cohorts, but declined thereafter. Both hospital days and out-of-Plan costs per pt-mo declined dramatically, beginning with the 1sthalfFY87 cohort. Outpatient visit rates climbed steadily between the FY86 and 1sthalfFY88 cohorts (3.9 to 7.7/pt-mo), ending at 7.5.
Conclusions. Lifetime utilization and costs reflected increasing survival, while monthly rates reflected the shift in emphasis to outpatient care, which began with the establishment of an AIDS consultative team.

M.H.0.15 PLACE OF DEATH MEASURES EFFECTIVENESS OF AIDS-SPECIFIC COMMUNITY-BASED SERVICES

Kruzich, A; Hopkins, Sharon; Wood, R. Seattle-King County Department of Public Health, Seattle, Washington, USA

Objective. To study place of death field on death certificates of persons with AIDS in Seattle-King County as an indicator of increased availability of community-based services.
Methods. We collected place of death data for the period 1984-1988 to analyze trends in place of death, and compared those data to the establishment and expansion of AIDS-specific community-based health and social services in Seattle-King County.
Results. 1) Expenditures to develop and support AIDS-specific home and community-based health and social services (exclusive of Medicare/Medicaid) increased from $40,000 anually in 1986 to $815,000 in 1988, an increase from $388 per person living with AIDS in 1986 to $2596 in 1988 in Seattle-King County; 2) Percentage of deaths occurring in hospitals decreased from 89% in 1984 to 72% in 1986 and 58% in 1988, while deaths in the home increased from 11% to 28% from 1984-88; 3) Deaths in stepdown care facilities increased during the study period, from 1% in 1986 to 14% in 1988; 4) Average length of stay per hospitalization for persons with AIDS decreased from 18 days in 1984 to 11 days in 1987.
Conclusions. 1) Development of community and home-based health and social support services and stepdown care options is associated with more deaths at home of persons with AIDS, and may reduce hospital utilization and costs; 2) Costs associated with the most expensive level of care, hospitalization, may be decreased by establishing and maintaining stepdown beds and support services to maintain persons with AIDS in the home.

M.H.0.16 POST DISCHARGE NEEDS OF HOSPITALIZED PERSONS WITH AIDS AND HIV RELATED ILLNESSES IN NEW YORK CITY

Rango, Nicholas,M.D.*;Anderson,E.J.*;Feldman,I.*;Collins, B.**;and Green,J.,Ph.D.***.*New York State Department of Health,Albany,New York,**New York State Department of Social Services,Albany,New York;***New York University Hospital,New York,New York.U.S.A.

Objective.This study identifies the post discharge service needs of 269 clinically stable patients with AIDS or HIV related illnesses in twenty New York City hospitals.
Methods.Twenty hospitals in New York City with the greatest numbers of 1987 discharges of patients with AIDS and HIV related illnesses were visited once between February and June,1988.Reviews of clinically stable patients with AIDS or HIV related illnesses,hospitalized for 10 days or more,were conducte using an assessment instrument measuring 106 patient attributes,in order to determine patients' post discharge needs.The variables:ability of the patient or coresident to direct care personnel,functioning status,and availability of a previous home to which to return,were used to determine the placement setting needed by each patient.
Results.A minimum of 14 percent of the 269 patients assessed needed a skille nursing facility upon discharge and 8.6 percent a health related facility. Adult care facilities were appropriate for 11.2 percent of the patients assessed,and individual housing for 17.4 percent.A total of 48.7 percent of patients could receive care in their previous homes.
Conclusion.This study documents the need for expanded residential care option for patient with AIDS and HIV related illnesses,both residences with health services provided and arranged congregate and individual housing.This need is increasing with the routine use of therapies which extend life expectancy.

M.H.0.17 RESOURCE USE AND COSTS OF CARE FOR AIDS PATIENTS IN LOS ANGELES.

Bennett CL, Pascal A, Bennett RL, Cvitanic M.
The RAND Corporation, California, U.S.A.

Objective: To describe the total resources use by AIDS patients.
Methods: Forty gay men in various stages of HIV infection were: (1) interviewed regarding hospitalizations (hosp), pharmaceuticals (pharm), labs, physician visits, social services (soc. serv.), health insurance and reimbursement for the two years (yrs) prior to the interview; and (2) asked to provide prospectively medical bills for one year.
Results: The subgroup of 15 men with KS (mean age of 40.6; range 31-65 yrs) had a mean of 1.27 inpatient hosp/yr (range 0-3); all but one were for evaluation or treatment of opportunistic infection. Mean inhospital costs/hosp were $11,879 ± $6,752 for 7.8 days, mostly for the room (36%), pharm (22%), MD (14%), and labs (15%). Mean outpatient costs were $23,780 ± $14,126, with over 50% of these related to pharm. Mean soc. serv. use was $5033 ± $3614, with 60% of these costs for mental health. The seven men who received chemotherapy for KS tended to use more resources than the other eight, mostly related to increased hosp, out-pt pharm, and lab tests. By 6/89, we will have similar data for 25 pts with PCP and other diagnoses and will convert resource use into physical units to facilitate international comparisons.
Conclusion: This sample of KS pts used a level of resources significantly greater than suggested in recent literature, mostly related to pharm, labs, and development of infections. We expect PCP pts to show ever higher resource use.

M.H.0.18 IMPACT OF DEGREE OF IMMUNE DEFICIENCY ON PLANNING OF PUBLICLY FUNDED OUTPATIENT SERVICES FOR H.I.V.

Dassey,David; C.Braithwaite. AIDS Program Office, Dept. of Health Services, Los Angeles County, California, USA.

Objective. To determine the accuracy of forecasts for outpatient HIV service needs in a public health agency.
Methods. Very few services are available to the asymptomatic HIV seropositive person without private insurance or access to research studies targeting this group, yet many researchers believe that secondary prevention may be of major importance for them. LA County has opened (2/89) a model clinic to assess medical, nursing and psychologic interventions for this population that will presumably reduce or postpone hospitalization by prophylaxis of certain opportunistic infections and by early detection and treatment of others. Under protocol, nurses provide periodic screening and treatment based on presence of symptoms as well as level of cellular immune function (measured by delayed hypersensitivity reactions [DHR] and T_4 helper cell count). Since total return appointments will vary based on the status of our self-selected clients, we are unable to project a maximum caseload for the given staffing pattern, nor project the cost of therapeutic interventions or monitoring tests. The following algorithm will be tested:
A) for T_4 > 400/mm^3 : no treatments, return in 6 mo.
B) for T_4 < 400 & > 200/mm^3, and DHR+ : return in 3 mo.
C) for T_4 < 400 & > 200/mm^3, but DHR-, or T_4 < 200 regardless of DHR : consider PCP prophylaxis [50% sulfa-trimethoprim, 50% pentamidine aerosol], and return monthly or more often.
Results. The following assumptions were made prior to the clinic's opening about the immune status of the volunteer patient population: group A, 50% ; group B, 30% ; group C, 20%. A comparison of maximal clinic caseload and costs for lab and drugs will be made between this assumption and the actual health status of the patient load seen during the first 3 mo.
Conclusion. Planning HIV preventive services is highly dependent on the degree of immune deficiency of target populations.

T.H.0.1

WORK DISABILITY AMONG AIDS CLINIC PATIENTS

Greenblatt, Ruth M. ; Yelin, E.; Hollander, H.; McMaster, J.; Kidd, S.; and Filson, M.
University of California, San Francisco, California, USA.

Objective. To describe the incidence, prevalence and predictors of work disability among 61 randomly selected AIDS clinic patients.
Methods. A cross-sectional study of medical and work histories which utilized a structured telephone survey instrument.
Results. Fifty-nine (97%) of the respondents reported symptom(s) which are associated with HIV-related illness. Fifty-three (87%) worked prior to onset of symptoms. The mean time between the onset of symptoms and interview was 2.3 years. Twenty-seven of the 53 (51%) stopped working during the period of time between onset of symptoms and study interview; 8(15%) during year 1, 13(29%) during year 2, 3(9%) during year 3, and 3(10%) during year 4. Among the 26 who remained working, the hours worked per week declined only slightly to 39 (±8). Among the 53 who worked prior to onset of symptoms, hours worked per week declined 52% to a mean of 19. Given the youth of the study participants (mean age = 30 years), and assuming that no additional work disability cases occur before retirement at age 62, 42% of the 40 year productive life span (PLS) of this population would be lost. However, assuming that a 10% disability incidence rate continues, 89% of the PLS would be lost.
Conclusion. This group of AIDS clinic patients experienced a 51% work disability rate within 3 years of the onset of symptoms. Since hours per week declined only slightly among those continuing to work, most of the lost productivity was due to a complete cessation of work. The incidence of work disability is estimated to result in the loss of 42-89% in the working life of this population.

T.H.0.2

FIVE YEAR AIDS PLANNING PROCESS AT A HEALTH MAINTENANCE ORGANIZATION

Anderson, Elizabeth S.; Thompson, R.L., M.D.; and Beery, W.L.
Group Health Cooperative of Puget Sound; Seattle, Washington, U.S.A.

Objective: To provide a basis for resource allocation and planning decisions, Group Health Cooperative (GHC), a large HMO, completed a five-year (1989-1993) service planning process identifying major AIDS-related resource needs and key policy issues.
Method: GHC identified multiple areas where it has AIDS-related responsibilities and issues: e.g., providing and coordinating health care services; preventive education; developing and administering insurance packages; as an employer; utilizing clinical and management information systems; and as a partner in community-wide projects. A multidisciplinary planning team gathered data; identified policy issues and resource needs, and forecast future impacts. The team used the HMO's data systems and CDC's AIDS caseload projection methodologies to predict future AIDS costs and caseloads.
Results: By year end 1993, GHC predicts a 500% increase in number of surviving PWA's, unevenly distributed over the HMO's service area. The direct medical costs of treating PWA's are estimated at $21,000/patient/year in 1988 and projected to total $20 million over 1989-1993. These increased costs and caseload have a major impact on future planning for hospital beds, staff, in-and outpatient budgets, and insurance rates. To meet legal mandates and clinical protocols, AIDS/HIV counseling volumes will increase 5 to 10 times to over 25,000 enrollees counseled/year, putting significant resource demands on primary care staff. Staff training needs in infection control, clinical management, counseling and confidentiality were identified. A system to coordinate the care and support services for PWA's across settings is needed. Strong ties to community-based AIDS efforts (e.g. prevention and subacute and long term care facilities) were shown to benefit the HMO and its enrollees. The planning team set directions for design and administration of the the HMO's "benefits package" to support care for PWA's; treat PWA's and other patients equitably; and reduce adverse selection potential.
Conclusion: Long term service planning provides HMO's with information to allocate resources needed for adequate AIDS treatment, care coordination, and prevention services; future bed and staffing levels; training; and benefits administration.

T.H.0.3

UTILIZATION OF COMMUNITY-BASED AND HOSPITAL CARE FOR PERSONS WITH AIDS IN SAN FRANCISCO, 1988-89

Stern, Adam C.; Chen, R.; Udall, L.; Frazier, Y.; Lifson, A.; Hernandez, S.; Pittman-Lindeman, M.; Rutherford, G. Department of Public Health, San Francisco, CA, USA.

Objective: To assess utilization of community-based and hospital care for persons with AIDS (PWAs) in San Francisco.
Methods: We defined 8 distinct care settings for PWAs and surveyed care providers to determine average daily census of PWAs in each setting during January 1988 and January 1989. Utilization was calculated as a percentage of living persons with AIDS in San Francisco, adjusted for reporting delays.
Results: Of the 2,859 living PWAs in San Francisco in January 1989, 82.2% were living at home without homecare, 7.8% were receiving homecare, 4.4% were in residential settings with social service support, 3.8% were in acute care hospitals, 0.6% were in skilled nursing facilities, 0.5% were in hospices, 0.5% were in substance abuse treatment, and 0.2% were in mental health treatment. The distribution of living PWAs in these settings did not significantly change from January 1988 (2,042 living PWAs) to January 1989.
Conclusions: On an average day, most PWAs in San Franciso (82.2%) are currently living at home without homecare. Only 3.8% of living PWAs are in acute care hospitals. The remaining group of PWAs receive home care or are served in a variety of community-based care settings. As the number of living PWAs in San Francisco is expected to rise to 6,288 by 1993, utilization patterns at all care settings will be critical for health care planning purposes.

T.H.0.4

ASSESSING THE COST OF AIDS TO BOTH PATIENTS AND THE HEALTH CARE INSTITUTION

Pittman-Lindeman, Mary*; Miller, D.; Sowa, P.E.
San Francisco General Hospital, San Francisco, California and *San Francisco Dept. of Public Health, U.S.A.

Objective: To describe and document the cost of AIDS to San Francisco General Hospital.
Methods: The authors review patient medical records to assess a base line of services provided. These services are compared to internal workload monitors (i.e., nurse acuity tool; medical record tasks; medical social worker/client hours). The cost is further evaluated by looking at individual service department workload related to HIV patient care. The cost to the hospital in staff hours, materials, supplies and equipment is compared with other overall hospital costs. The cost of AIDS is also considered as an opportunity cost and the authors attempt to quantify the programs that have lost support or resources while the hospital staff have directed their efforts to AIDS.
Results: The review of medical records and departmental monitors clearly show that key hospital services are disproportionately involved in HIV care and that those services are typically not part of the billing documents. The paper describes a model that each health care institution can adopt in evaluating the cost of AIDS care.
Conclusion: The cost of AIDS care must be evaluated from the impact on the individual patient as well as the cost to a health care institution. This paper attempts to quantify those departmental expenses. It also raises the question of the emotional cost to our health care workers. Although this issue is not quantified, it is a crucial factor in assessing the real cost of AIDS.

T.H.0.5

PUBLICALLY-FUNDED COSTS OF COMMUNITY-BASED EDUCATIONAL PROGRAMS BY RISK CATEGORY IN SAN FRANCISCO

Evans, Patricia E.; Herring, M.; Rutherford, G.W.; Amory, J.W.; Cowne, D.; Nguyen, B.; Hembry, K.; Werdegar, D., Department of Public Health, San Francisco, CA USA

Objective. To evaluate publically-funded costs of community-based AIDS prevention/education program by risk category.
Methods. We reviewed all monies (federal, state and city) for the 12-month period July 1987 through June 1988 and categorized funding for 11 community-based organizations (CBOs) according to target populations. We determined per capita expenditures using estimated sizes of specific risk groups.
Results. Total public funding for the 12-month period was US$5,751,579. Of this amount, $3,311,127 (58%) was subcontracted to 11 CBOs according to the following target populations:

	Total Funding(X$1000)	Per Capita
Homo/bisexual men (including IVDUs)	$1,009 (30%)	$17.39
IVDU	897 (27%)	74.76
Heterosexual*	474 (14%)	4.82
General Public	520 (16%)	1.31
Provider Education	411 (12%)	16.60
TOTAL	$3,311	5.72

*Defined as heterosexual partner of an intravenous drug user or bisexual man or heterosexual with >2 sexual partners in last year.
Conclusions. San Francisco's comprehensive educational program includes $2,380,217(72%) of community-based funding targeted towards high-risk groups and $930,911(28%) towards the general public and provider education.

T.H.0.6

COMMUNITY-BASED RESEARCH IN AIDS: CRI AS MODEL

Thomas Hannan, NY Community Research Initiative

OBJECTIVE. To demonstrate how community-based research can represent a successful alternative model for the design and conduct of clinical research in AIDS, expanding the number of study participants and increasing compliance (especially including minorities and groups normally underrepresented in trials), employing community physicians and incorporating the perspective of people with AIDS in the process.
METHOD. The CRI is registered and approved by the New York State Department of Health to sponsor well-designed, meaningful, clinical trials of promising AIDS/ARC treatments conducted in a community setting by qualified physicians in cooperation with informed volunteer subjects recruited from their practices. The CRI has its own Board of Directors, an impressive Institutional Review Board (IRB) and a Scientific Advisory Committee composed of scientists and clinicians thoroughly experienced in the field of AIDS.
RESULTS. Although the CRI has been in existence for little more than one year, it already has 5 IRB-approved clinical trials fully enrolled and underway, as well as 4 other important formal studies about to begin. In addition, the CRI has an informal monitoring project of antabuse, the results of which were presented at the IVth International Conference on AIDS in Stockholm. The CRI has also generated a report submitted for publication on the endocrine abnormalities in AIDS of low DHEA levels. Both reports represent evidence of CRI's ability to collect and present meaningful data quickly.
We are prepared to present the procedures for development of research projects from potential sources, approval process and actual conduct of based research conducted in an AIDS context.

Coûts dans les pays en voie de développement
Costs in Developing Countries

T.H.O.7 COST EFFECTIVENESS ANALYSIS OF BLOOD SCREENING TESTS

Wong, Holly; Makinen, M. Abt Associates Inc., Washington, DC, United States.

Objective. To analyze the cost-effectiveness of various methods of screening blood samples for HIV antibodies in developing countries.
Methods. A methodology has been developed for calculating and comparing the costs for various methods of testing blood samples for HIV antibodies. It consists of a general conceptual framework to be used in approaching the analysis of a testing system (sequence of tests) and software that can be adapted for individual circumstances. Preliminary work is based on the testing system at the Mama Yemo Hospital in Kinshasa, Zaire. All cost elements associated with the major types of screening tests are identified and built into an interactive microcomputer model which will evaluate costs for any given testing system. The user can insert key parameters or choice variables into the model and predict the cost of a particular system under specific circumstances.
Results. Such analyses will predict the effects of alternative means of preventing blood samples containing HIV antibodies from being used, and will measure the per unit cost of excluding these samples from the health system.
Conclusion. This methodology can be adapted to specific national or regional circumstances, and will assist decision makers in understanding what alternatives are available to them and to make cost effective and rational choices in the use of limited resources.

T.H.O.8 PROSPECTIVE QUANTIFICATION OF THE ECONOMIC AND MORBID IMPACT OF PERINATAL HIV INFECTION (PI) IN A COHORT OF 245 ZAIRIAN INFANTS BORN TO HIV(+) MOTHERS

Mopso, Ntumbanzondo*; Engele, D.*; Bertozzi, S.**; Hassig S.*; Ryder, R.*/***. *Projet SIDA, Kinshasa, Zaire; ** MIT, Boston, MA; ***CDC, Atlanta, GA.U.S.A.

Objective. To prospectively determine the health care costs associated with perinatally-acquired infection (PI) in infants of HIV(+) mothers born at Mama Yemo Hospital (MYH), Kinshasa, Zaire.
Methods. For a 12 month period in 1987/88, all medical care was provided and its cost quantified for 3 groups of infants with age at study enrollment of 9 to 12 months. Group I had 65 children born to HIV(+) mothers with PI (HIV IgG at age 12/18 months or clinical AIDS). Group II had 180 children with HIV(+) mothers but without PI. Group III had 319 control children with HIV(-) mothers.
Results. Economic and morbid measures per child-year observation

		Group I	Group II	(P)	Group III	(P)
Admitted to Observation Ward		.82	.36	(<.01)	.26	(<.01)
Hospitalisations:	Number	.43	.11	(<.01)	.05	(<.01)
	Duration (Days)	4.83	1.26	(<.01)	0.41	(<.01)
Medication costs:	Antipyretics	13.70(USD)	11.62	(<.05)	10.62	(<.05)
	Antidiarrheals	19.08	11.28	(<.01)	10.54	(<.01)
	Antihelminthics	7.96	5.11	(<.05)	5.15	(<.05)
	Antibiotics	25.01	14.35	(<.01)	12.58	(<.01)
	Topicals	14.80	5.80	(<.01)	11.59	(<.01)
	TOTAL	99.92	72.93	(<.01)	67.89	(<.01)
Total health cost		163.42	110.09	(<.01)	99.83	(<.01)

(p values compare GpI with GpII and GpI with GpIII.
Among Group I children per child monthly expenses were greatest for children aged 22 months ($32.00), 11 months ($26.11) and 10 months ($23.93).
Conclusions. Because costs in this study were born by the research team and not by the family of each child, they reflect the cost of optimal therapy at MYH. Gp I children had health care costs 48% greater than those of Gp II and 64% greater than those of Gp III.

T.H.O.9 THE ECONOMIC IMPACT OF HIV INFECTION IN ADULT ADMISSIONS TO INTERNAL MEDICINE (IM) AT MAMA YEMO HOSPITAL.

Hassig, Susan E.*/**; Perriens J.*; Baende, E.*; Bishagara, K.*; Ryder, RW.*/***; Kapita B.****. *Projet SIDA, Kinshasa, Zaire; **Tulane University, New Orleans, USA; ***CDC, AIDS Program, Atlanta, GA; ****Mama Yemo Hospital, Kinshasa, Zaire.

Objective. To determine the economic impact of HIV infection to the infected individual and to Mama Yemo Hospital (MYH).
Methods. A systematic 50% sample of all adult admissions to the Department of IM from 9/27 to 12/15/88 were recruited. Blood was drawn for HIV serology, and information collected on previous medical care expenses, recent disruption in living situation, and nature of the current cause of admission. Daily expenses accrued during the hospitalization were tabulated.
Results. Fifty % of 236 adult admissions were HIV+ by ELISA and Western blot; 49/112(44%) of males, 68/124(55%) of females. While the average length of stay for both HIV+ and HIV- patients was 8 days, 47% of HIV+ admissions resulted in death vs 30% of HIV-(p=0.01). No difference was found in the mean cost of hospitalization for HIV+ (48 USD) and HIV- (45 USD) patients. Of HIV+ admissions, 42% had experienced a major disruption (42% loss of job, 9% divorce, 10% change of residence) due to their illness vs 24% for HIV- (p=0.006). HIV+ patients had spent twice as much for treatment prior to their admission as HIV- (97 USD vs 48 USD, p=0.05).
Conclusion. The medical consequences of HIV infection are placing a heavy financial burden on the infected individuals and their families. The high prevalence of HIV in IM admissions implies that one half of the resources of the IM Dept of MYH are expended for HIV-related care.

T.H.O.10 COMPARATIVE STUDY OF A COMPREHENSIVE VERSUS A TRADITIONAL SYSTEM OF AIDS HEALTH CARE IN SAN JUAN, PUERTO RICO

Kouri, Yamil*; Balling, J.D.*; Garib, J.**; Borrás, F.***; Rullán, J.****; Sotomayor, J.**.
*Harvard Institute for International Development, Cambridge, MA, USA; **San Juan AIDS Institute, San Juan, PR; ***San Juan Department of Health, PR; ****Department of Health of the Commonwealth of Puerto Rico, San Juan, PR.

Objective. To compare the cost-effectiveness, coverage, and performance of a new comprehensive approach to the treatment and prevention of HIV infection in San Juan with the traditional hospital-based strategy.
Methods. The treatment of all AIDS patients under the traditional system in 1987 (N=128) and that under the new comprehensive system in 1988 (N=398) were compared. Based on medical records, all services, tests, procedures, pharmaceuticals, etc. were recorded for each patient for each day of treatment. The daily and yearly medical costs were analyzed in terms of the socio-demographic, medical, treatment, and institutional variables that influenced direct medical costs. AIDS health care staff in both systems were interviewed to assess their views of the performance of each institution.
Results. Compared to the traditional system, the comprehensive system: 1) decreased the average length of stay for AIDS patients, 2) decreased the average yearly cost of care per patient, 3) reduced the proportion of the AIDS health care budget spent on patient care, 4) increased the proportion of HIV infected individuals in San Juan who received treatment, and 5) increased the funds expended on epidemiology and prevention.
Conclusion. Patient management strategies that de-emphasize in-patient care and provide alternatives, such as home, extended, and hospice care can substantially reduce the direct medical costs associated with AIDS.

T.H.O.11 AN ANALYSIS OF DIRECT AND INDIRECT COSTS OF AIDS AND ARC IN MEXICO

Tapia, Roberto*; Martin, A.**; Lipscomb, J.***; Bratt, J.**.
*Ministry of Health, Mexico City, Mexico, **Family Health International, Research Triangle Park, North Carolina, USA, ***Duke University, Durham, North Carolina, USA.

Objective. To measure the current and projected cost impact of AIDS and ARC in Mexico.
Method. Over 500 medical records of AIDS and ARC patients were analyzed retrospectively and 100 patients were followed prospectively from admission until death. Direct treatment costs (both public sector and out-of-pocket) were measured using information from the medical records. Indirect costs due to lost productivity were estimated. Statistical analysis was used to explain variations in costs and to project future costs. Costs of AIDS control and prevention activities were measured and a model established that projects relative costs for alternative approaches to treating and preventing AIDS in Mexcio.
Results. The direct treatment costs of AIDS and ARC consume a significant portion of public sector health resources. These costs are expected to increase sharply over the next five years. Indirect costs are higher than direct costs. The projected costs of AIDS and ARC can be reduced through interventions that prevent HIV transmission.
Conclusions. The Mexican government should anticipate increased demand for its health resources due to the rising costs of treating AIDS and ARC patients. One strategy for reducing these costs may be to invest more resources in programs designed to prevent HIV transmission.

T.H.O.12 COSTS OF AIDS IN A DEVELOPING AREA: INDIRECT AND DIRECT COSTS OF AIDS IN SAN JUAN, PUERTO RICO

Shepard, Donald S.*; Kouri, Y.*; Borras, S.**; Garib, J.***; and Balling, J.
*Harvard Institute for INternational Development, Cambridge, MA USA, **City of San Juan (SJ) Health Department, SJ, PR, ***SJ AIDS Institute, SJ, PR.

Objective. To assess the costs of AIDS to guide control efforts.
Methods. We began with projected numbers of new clinical AIDS cases in children, adult males, and adult females in SJ for the years 1988 through 2000. We derived lifetime treatment costs (average $50,000 per case) from insurance data and previous prtrospective studies. We cumulated lost earnings from premature death from age 16 (in children) and age 34 (adults) to age 64 using the SJ average wage and unemployment rates, a 2% productivity growth, and a 5% discount rate.
Results. The projected number of AIDS cases in SJ would quadruple from 198 in 1988 to 933 in 1992. Over this period, direct costs would escalate from $10 to $47 million (in constant 1987 prices) and total economic costs from $23 to $106 million. If present trends continued, in the year 2000 direct costs for the projected 23,000 new cases would be $1.1 billion ($1000 per resident of SJ) and total economic costs $2.6 billion.
Conclusions. Direct costs are expecially important in SJ because most medical care is publicly provided and medical costs approach those of the mainland U.S. Indirect costs, based on SJ wages, are substantially lower than those in the mainland. Thus. innovations in SJ to establish more cost-effective, comprehensive systems of AIDS care are critical. Economic studies are useful to guide policies and strategies for AIDS control.

POLICY CHALLENGES OF THE SOCIO-ECONOMIC IMPACTS OF THE AIDS PANDEMIC: A CO-ORDINATED RESPONSE BY THE UNITED NATIONS SYSTEM

Desmond, Gerald M.*
*United Nations Department of International Economic and Social Affairs, New York, New York, United States

Objective. To define an international policy-oriented research agenda on the socio-economic implications of AIDS for the relevant agencies of the United Nations system and the academic and scientific community.
Methods. Models will be developed to provide realistic scenarios of socio-economic impact of AIDS in areas such as food and agriculture, socio-economic stability and growth, national health services and priorities, labour and employment. These scenarios are designed to anticipate the future course of the pandemic under different demographic assumptions as a guide to national governments and international organizations to explore appropriate policy options. Methodologies based on multivariate models, logistic regression, multiple imputation methods, cross-sectoral analysis and others will be used in the analyses.
Results. A nuanced set of scenarios and policy alternatives to facilitate the recognition of policy issues that may arise depending on the severity of the pandemic over the next five to fifteen years. Incorporated into these scenarios will be the socio-economic differences among nations of the world and among HIV patterns I, II and III.
Conclusions. A set of recommendations will be established on alternative strategies to anticipate and deal with the socio-economic and humanitarian aspects of AIDS and its impact at a policy/programming level.

T.H.O.16

SOME ECONOMIC IMPLICATIONS OF INTRODUCING CONTROL MEASURES TO REDUCE THE SPREAD OF HIV INFECTION IN SUB-SAHARAN AFRICA

Rowley, Jane, Ng, T.W. and Anderson, R.M.
Pure and Applied Biology, Imperial College, London, UK.

Objective. This paper looks at the demographic and economic implications of introducing measures to control the spread of HIV infection in a country in sub-Saharan Africa.
Method. The consequences of introducing control measures at different times is explored using a simple mathematical model of the transmission dynamics of HIV infection that incorporates both epidemiological and demographic processes. The controls considered include the screening of blood for transfusions and measures to reduce the probability of the sexual transmission of HIV either by a reduction in sexual partner change rates or by the adoption of "safer sexual practices".
Results and Conclusion. The costs of these measures and the corresponding number of cases of HIV infection and AIDS prevented are used to show the costs and benefits of prevention. Results show the importance of the early introduction of control measures; any delay substantially increases the severity and potential costs of the future epidemic.

W.H.O.4 WHO PAYS FOR AIDS IN THE UK LIFE- INSURANCE INDUSTRY?
Harris, Dai; Legal Officer, The Terrence Higgins Trust Legal Centre. UNITED KINGDOM

Objective: To critically examine how the UK life insurance industry has responded to HIV. To answer the question, who pays for AIDS in the UK insurance industry?
Method: A short history of life insurance and AIDS since 1986 and the legal status of the insurance contract. Future mortality projections, from Sir David Cox and The Institute of Actuaries. What are the assumptions of their reports and what is their margin of error?
Underwriting techniques - the identification of the risk group, and the risks of the group.
Is sex identified as the risk factor? Use of the supplementary questionnair asking direct questions and use of the antibody test. The anti-selection effect of these policies. Using the exclusion clause to exclude risk. Is moving out the better option, for the industry and customer?

Conclusion: So who is paying for AIDS claims? Presently the new customer pays with increased premiums and the industry to a very small extent by setting aside reserves.

EMPIRE BLUE CROSS AND BLUE SHIELD: THE FIRST 7500 AIDS CASES

Eisenhandler, Jon*, Padgug, Robert*
Empire Blue Cross and Blue Shield, New York City, USA

Objective: To describe the experience of Empire Blue Cross and Blue Shield with its first 7500 AIDS cases, and to draw conclusions regarding health insurance coverage, costs per case and trends in types and sites of treatment.

Methods: Presentation of Empire's policies regarding insurance coverage for AIDS followed by statistical analyses of hospital and medical claims data for persons with AIDS insured by Empire

Results: Lifetime health care costs for persons with AIDS covered by Empire are approximately $60,000 per case, significantly below many early cost estimates. Costs have been stable through the course of the epidemic because of a decline in inpatient utilization.

Conclusion. Costs for the treatment of persons with AIDS are manageable, even when the number of cases is large and there is easy access to health care providers. Results should be useful for private insurers, governmental bodies, and other institutions concerned with trends in costs and with insurance coverage issues.

W.H.0.9

THE COST OF HIV-RELATED HEALTH INSURANCE CLAIMS IN THE UNITED STATES.

Eby, Charles. Health Insurance Association of America. U.S.A.

Objective. To present data on the cost of health and disability insurance claims related to the HIV epidemic for 1976 and 1987. (Data for 1988 may be available by the time of the conference.)
Methods. Each year since 1986, the Health Insurance Association of America and the American Council of Life Insurance have surveyed their members to collect data on claims related to HIV illness. Although not all HIV-related claims are identified, this survey provides the best estimate currently available of the HIV-related costs paid by insurance companies.
Results. The percentage of claims related to HIV illness is small, but increasing rapidly. There is wide variation in impact among companies, with a substantial number of companies experiencing no HIV-related claims, while others report more than 4 percent of claims related to HIV illness.

W.H.0.11

NATIONAL SURVEY OF STATE SPENDING FOR AIDS PROGRAM ACTIVITIES

Rowe, Mona J.*; Ryan, C. C.*; Keintz, R.M.* ; and Merritt, D.M.*, Richland, J.**, Madden, S.**,and Farrell, K.***.
*Intergovernmental Health Policy Project,The George Washington University, **Public Health Foundation, ***National Association of State Budget Officers, Washington, D.C. U.S.A.

Objective. To report on findings from a 50-state survey of 1989 state appropriations for AIDS funding (non-Medicaid) across all state departments and by program area. Methods. A pre-tested questionnaire was distributed to a Governor's designated sample of state budget officers and health officials, with assistance from related organizations. Results. Preliminary survey results show that states are appropriating AIDS funds to a variety of state agencies besides health, including those in corrections and education. Total state-only funding (non-federal) for AIDS has increased by at least a third from the previous fiscal year. Almost four-fifths of the states have appropriated funds from their own general revenues. Those with no state funding continue to rely on federal grants, primarily for education and surveillance activities. AIDS has changed the source of support for public health activities, with the private sector directly funding service programs sponsored by state and local governments. The findings document the shift in AIDS funding for specific program activities and demonstrate the amount of state and federal funds passed through to local governments and community based organizations. Conclusion. Federal funding will continue to influence how states spend their own funds. States are using state funds to develop model programs for service delivery, planning and outreach to special populations.

W.H.0.8

HEALTH INSURANCE INDUSTRY MODELING OF THE HIV EPIDEMIC IN THE UNITED STATES.

Eby, Charles*; Dinius, J.**. *Health Insurance Association of America, **AEtna Life and Casualty, U.S.A.

Objective. To present the results of a model developed jointly by the Health Insurance Association of America and the American Council of Life Insurance.
Methods. A joint committee of the two trade associations developed a model for forecasting AIDS cases and claims costs through the year 2000, using a range of scenarios. This presentation discusses the assumptions, methodology and results of this modeling effort.

W.H.0.10

ANALYSIS OF AZT ASSISTANCE PROVIDED BY A PRIVATE HOSPITAL

Benge, Mark; Cintron,M.; Muniz,R.; Watson,T.; St. Clare's Hospital and Health Center, New York, NY, U.S.A.

Objective: To identify gaps in third party coverage of AZT

Methods: Analyzed free distribution of AZT during six months at St. Clare's Hospital, NYC to various financial classifications in relation to: 1) date Retrovir available for purchase; 2) dates of various stages of progression of governmental AIDS Drug Assistance Program (ADAP); 3) date assistance effective to individuals; 4) date patient first aware of assistance.

Results: Seventy-three patients were given 45,868 AZT capsules, cost approx. $74,765. Breakdown of capsule distribution as follows: Medicaid eligible, patient not notified by govt.: 24%. ADAP eligible, no action taken by Fed. Govt.: 6%. ADAP eligible, applications not available: 16%. ADAP eligible, program not implemented: 9%. Covered by private insurance, unable to afford out-of-pocket outlay: 33%.

Conclusions: Non-governmental agencies must be aware of bureaucratic delays in providing governmental assistance for new drugs and that patients are often unable to meet out-of-pocket expenses necessary with private third party coverage. These agencies must implement mechanisms to ensure interim assistance is available.

W.H.0.12

FINANCING THE MEDICAL COST OF THE HIV EPIDEMIC IN THE UNITED STATES: A POLICY REVIEW

Makadon,Harvey J*; Seage GR**; Thorpe KE*; Fineberg HV*.
* Center for Policy and Education, Harvard AIDS Institute, Harvard School of Public Health;
** Department of Health and Hospitals, Boston, MA, U.S.A.

Objective: To review strategies to provide access to care to people with HIV infection in a country without universal health insurance.
Methods: We use explicit criteria to evaluate use of policy options to provide increased access to care for those with HIV infection in the United States. The options include: Use of state risk pools and provider subsidies, employer mandates, and expansion of public financing programs, Medicaid and Medicare.
Results: The complex health care needs of persons with HIV infection highlight inadequacies in our fragmented health care financing systems and raise serious questions concerning how best to pay for care. While the total cost of caring for an individual with AIDS is similar to the cost of caring for those with other catastrophic illnesses, these costs do have a significant impact on both affected individuals and regions of the country that have been hard hit by the epidemic.
Conclusion: We recommend approaches to broaden the available continuum of care through improved financing mechanisms. In order to provide more universal access to care, we recommend changes that will extend eligibility for private insurance among the previously employed, extend Medicare and Medicaid coverage, and establish state funds for the uninsured.

W.H.O.14

USE AND COSTS OF HEALTH CARE SERVICES OF PERSONS WITH AIDS IN THREE PRACTICE SETTING IN SAN FRANCISCO. 1986/87

Scitovsky, Anne*, Cline, M *
*Palo Alto Medical Foundation, Palo Alto, California, U.S.A.

Objective: To determine if there were differences in use and costs of health care services of persons with AIDS depending on the practice setting in which they received care: fee-for-service physicians, public hospital or prepaid health plan.
Methods: Cohorts of 83 AIDS patients of fee-for-service physicians and of 35 patients treated at a public hospital (San Francisco General Hospital, SFGH) were enrolled in the study and followed for all their use and costs of medical services for 12 months, or until death if this occurred sooner. A random sample of 44 AIDS patients who were members of a prepaid group plan (Kaiser) and who received care during the same period as the two enrolled cohorts were selected, and data on all their use of health care services obtained from their medical records.
Results: The highest costs were incurred by patients treated at SFGH, mainly because they were the highest users of inpatient hospital care. Kaiser patients had the lowest use and costs of physician outpatient services. The use of home health services was about the same for patients treated at SFGH and by fee-for-service physicians, accounting for 6% and 8%, respectively, of total expenses.
Conclusion: Although there were differences in the patterns of use and costs between patients treated in the three practice settings, the differences were not substantial and the basic practice pattern similar.

W.H.O.15

FORECASTING THE MEDICAL CARE COSTS OF AIDS IN THE UNITED STATES: 1989-1993

Hellinger, Fred J., Ph.D.
National Center for Health Services Research, U.S. Dept. of Health and Human Services, Rockville, Maryland USA

Objective. To forecast the personal medical care costs of patients with AIDS in the United States during the years 1989 through 1993.
Methods. Statistical extrapolation models and back-calculation methods yield projections on the future number of AIDS cases using data reported to the Centers for Disease Control (CDC) between January 1984 and January 1989. Information on the cost per case is obtained from insurance companies, Medicaid agencies, HMOs, and hospitals.
Results. The model yields projections on the future number of AIDS cases which are higher than those of most earlier projections. An estimate of $60,000 per patient holding between 1989 and 1993 is used to project medical care costs.

Year	CDC (Updated) Number of Cases	Hellinger Number of Cases	Hellinger Cost (billions)
1989	49,000	50,500	$3.0
1990	60,000	65,500	$3.9
1991	71,000	83,000	$5.0
1992	80,000	107,500	$6.2
1993		124,000	$7.4

Conclusion. The economic impact of AIDS in the United States will be greater than expected over the next five years.

W.H.O.16

SCENARIOS LINKING EPIDEMIOLOGY AND ECONOMICS: POSSIBLE IMPACTS OF DRUG TREATMENT OF HIV-INFECTED IN THE FRG.

Leidl, Reiner *
* Institute for Medical Informatics and Health Systems Research/GSF, Munich-Neuherberg, FRG

Objective. Assessing and forecasting economic impacts of AIDS should cope with varying ideas of future spreads of the infection, resource needs for care, and possible medical advances. To derive effects of such alternative assumptions, scenario techniques are proposed and discussed.
Methods. Scenarios are drawn from a deterministic, PC-based model. Programs include a menu guided version for single runs and shells for fast sensitivity analyses. The epidemiologic part is formulated for a high- and a normal-risk group, links the spread of infection (weighted exp- and log-functions) with a 'development of the disease' model (based on transition data). It produces yearly prevalences for three case types (HIV, LAS/ARC, AIDS). These are linked with impact functions for the indicators: years of life lost (y) for social burden, hospital beds (b) for capacities, health care expenditures (x) for direct cost (data from cost studies). Behavioral changes were indicated by 4 levels of infection growth reduction (r) since 1987. As the main question, drug treatment was assumed for all HIV-infected from 1990 on with 11 classes of effectiveness (e:0-1) from not up to completely stopping disease progress, and 15 price categories (p: 800-12000 DM).
Results. 31680 starting sets of epidemiologic parameters were condensed into four basic types. From I to IV, they decrease in high-risk group size and future spread of AIDS, but fit AIDS cases reported in the past. 1990-1992 impacts of drug treatment are compared with no drugs for I..IV: e.g., if ($e=.6$, $p=7200$, $r=0$) then (y: -37..-32%, b: -40%, x: 168..108%, x/y: 16300..8800 DM). Only at $p<1800..2400$ expenditures would not increase - well below current AZT-treatment prices ($dx/de<0$, while for $p>4800..6400$ even $dx/de>0$). Increasing r reduces x/y especially for low e - i.e., with ineffective drugs, effective prevention substantially lowers the price of life years gained.
Conclusion. With scenario inputs covering relevant ranges, this flexible tool (adaptable to different country contexts) allows to analyse the dynamics of economic impacts of AIDS.

W.H.O.17

DEVELOPMENT AND APPLICATION OF A MODEL HIV INFORMATION SYSTEM

Hidalgo, Julia .*; Hamidi, C.* .
*Maryland Department of Health and Mental Hygiene, Baltimore, MD., U.S.A.

Objective. As the AIDS epidemic has grown in the U.S.A. during the 1980's state and local governments have assumed a major role in the planning, funding, provision, and evaluation of AIDS health services. Automated information systems of varying designs and sophistication are being developed across the country to assist state and local policy makers and program administrators in these activities. This paper describes characteristics of a model statewide AIDS health services information system, factors impeding its development, efforts to overcome these impediments, and applications of the information system for a variety of program planning and evaluation activities. Methods. An automated information system linking AIDS registry, vital statistics, hospital, long term and chronic care, clinical trial, community-based service, and health insurance claims records to measure the nature, volume, and costs of service use associated with AIDS treatment during the period between AIDS diagnosis and death. Resource consumption among socio-demographic and AIDS transmission groups, women, children, the homeless, the severely mentally ill, and persons with psychoneuriatric complications of HIV infection can be measure. The fiscal impact of AIDS treatment on public and private institutions and third party payers and movement across facilities and insurers may also be assessed. Conclusion. Since the health services information system draws upon secondary data bases available in other states, this system may serve as a prototype for state and local agencies.

ALLOCATION DE RESSOURCES
DECISIONS POLITIQUES ET CONTRAINTES

Prof. P.M.Johnson, b.a., ll.l., m.d.
ancien premier ministre du Québec; Faculté de droit et Centre de Médecine, d'éthique et de droit, Univ. McGill, Montréal.

Objectifs: Faire état des principales contraintes imposées aux décideurs politiques dans les questions relatives à l'allocation des ressources pour faire façe au SIDA.

Méthode: Donnés empiriques puisées de l'expérience récente et de certains enjeux politiques canadiens touchant le SIDA.

Résultats: Les contraintes générales qui s'appliquent à l'allocation des ressources en Santé s'appliquent au SIDA. Certaines préoccupations dites morales et les catégories de citoyens les plus touchés par la maladie ont un effet sur la position du ministre façe à ses collègues dans l'arbitrage général des budgets et des priorités. Les aspects épidémiques du SIDA compensent dans cette situation: d'où l'importance des donnés comparatives et des références à la situation internationale.

Conclusions: Les aspects touchant le caractère épidémique de la maladie, les projections sur la progression de la maladie et les démonstrations claires de comportements préventifs efficaces forment des matériaux essentiels pour les décideurs élus.

Th.H.O.3

DATA GAPS IN MODELING AIDS SERVICE UTILIZATION AND COSTS

Bilheimer, Linda T.

Mathematica Policy Research, Inc., Washington, DC, USA.

Objective. To identify major data gaps and other methodological problems in modeling AIDS and HIV-related service needs, service utilization, and costs. Methods. A microcomputer-based AIDS service utilization and cost model has been developed for use at the state and local level. Results. Data needs for state and local modeling are identified in six major areas: AIDS and HIV-related morbidity incidence projections; risk group and diagnosis distributions; survival probabilities; payer distributions; service utilization rates; and costs per unit of service. Other important methodological issues include: projection methods for low prevalence states; implications of different prevalence measures; lack of standardization of definitions and measurement methodologies; the need for longitudinal studies of service utilization and costs; and modeling nonacute care service needs. Conclusions. The modeling exercise demonstrates the inherent problems in attempting to model AIDS and HIV-related service utilization and costs using existing data sources, and identifies where priorities for data collection and methodological research should be placed.

THE IMPACT OF ZIDOVUDINE ON AIDS-RELATED HOSPITAL ADMISSIONS. HOW LONG DOES THE HONEYMOON LAST?

Ng, T; Montaner, JSG; Schechter, MT; McLeod, A; Willoughby, B; Beardsell, A and Ruedy, J. AIDS Research Program, St. Paul's Hospital, University of British Columbia, Vancouver, BC, Canada.

OBJECTIVE. To assess the impact of zidovudine (ZDV) on AIDS-related hospital resource utilization.
METHODS. Data was gathered from the Provincial AIDS Registry, Medical Records Department, St. Paul's Hospital (SPH), and the Open Canadian Retrovir Trial (an ongoing trial, started in November 1986, where patients received 1200 mg/day of ZDV, under close medical supervision). The following variables, divided according to treatment groups, were compared on a quarterly basis:

I. AIDS vital statistics
II. AIDS related hospital admissions
III. Length of hospital stay

RESULTS. The number of alive AIDS subjects in the province of British Columbia increased steadily over the 2 year study period from 82 in the third quarter of 1986 to 194 in the second quarter of 1988. Over 70% of AIDS patients at all times were cared for at SPH. The number of separations and hospital days increased steadily until the third quarter of 1987 from 48 to 64 and 669 to 999 respectively. Both separations and hospital days failed to rise as predicted and actually decreased to 53 and 796 respectively by the fourth quarter of 1987. This could be at least partly attributed to ZDV therapy based on the fact this unusual reversal of trend occurred shortly after the time that ZDV became available and that 50% of alive AIDS patients receiving ZDV only contributed to 25% of separations and 19% of hospital days. At the time, given the available data from prospective ZDV efficacy studies, we predicted that if this phenomenon was due to a ZDV effect it should be self-limited. In fact by the second quarter of 1988, the number of separations and hospital days had reached similar proportions to those in early 1987, prior to ZDV therapy (68 and 923 respectively) and both variables continue to grow with an unequivocal upward trend.
CONCLUSION. Our data suggests that ZDV decreases the short term hospital resource utilization by AIDS patients; this honeymoon effect is however, short lasted and appears to wane within 1 year.

* Supported in part by the National Health Research Development Program (NHRDP), Health & Welfare, Canada.

M.H.P.2

EFFECTS OF THE USE OF AZT ON THE MEDICAL CARE COSTS OF PERSONS WITH AIDS IN THE FIRST 12 MONTHS

Scitovsky, Anne*; Cline, M.*; and Abrams, D.**
*Palo Alto Medical Foundation, Palo Alto, California, USA, **San Francisco General Hospital, San Francisco, California, USA.

Objective: To compare the medical care use and costs of persons with AIDS taking AZT with the use and costs of a matched group of persons with AIDS not using AZT.
Methods: Eight persons with AIDS participating in the Burroughs-Wellcome Phase two drug trial at San Francisco General Hospital in 1986 were matched with eight other AIDS patients who would have qualified for the trial but did not participate. These two cohorts were followed for one year and all information on utilization of and charges for medical services were collected.
Results: Mean monthly costs of the controls were more than twice those of the AZT patients, due entirely to the significantly greater use of inpatient hospital services of the controls.
Conclusion: Medical care costs of persons with AIDS who started taking AZT within 120 days of their first episode of PCP were, for the first 12 months, substantially lower than costs of a comparable group of patients not taking AZT. However, it is by no means certain that over their lifetime their costs will be significantly lower. Our data show that already, in the second six months, AZT users use of inpatient services rose substantially. Therefore, medical care costs plus the cost of AZT make it improbable that lifetime costs for AZT users will be lower than for comparable patients not using AZT.

M.H.P.3

ROLE OF A DEDICATED HIV/AIDS WARD IN A CENTRAL LONDON TEACHING HOSPITAL

Singh, S.; Connolly, G.M.; Hawkins, D.; Gazzard, B.
St. Stephen's Hospital, London, England.

Objective To analyse the use of inpatient beds in the first quarter of 1988 on a dedicated HIV/AIDS ward in a central London hospital.
Methods A prospective independent daily assessment was made of all HIV antibody-positive (HIV+ve) inpatients over a 3 month period. Each patient was categorised as receiving active investigation/treatment or social care (self-caring but social conditions prevented discharge) or terminal care (no active treatment, with no possibility of independent living).
Results Of the 221 HIV+ve admissions, 154 were under the care of the AIDS team. The remaining 67 were surgical. A total of 97 patients made up the 154 admissions (all except 2 gay men). A breakdown is as follows:

GROUP/Nos. of patients	Admissions	Bed-days	Overall occupancy
Blood transfusions/30	49	47	11%
GI Investigations/ 19	44	44	
Pneumonia/20	20	309.5	31%
Neurology/8	8	129.5	13%
Terminal/8	10	130.5	13%
Social/6	8	75.2	7.5%
OVERALL/97	154	991.6	93%

Conclusion This study reveals 1:2 admissions are short-stay (<7 days). The largest load results from treatment of pneumonia, half of whom could be treated as out-patients (Pa O2 > 8KpA). Admissions for terminal care and social support occupy a small proportion of beds. This has important implications for resource allocation as the epidemic unfolds.

M.H.P.4

DIGESTIVE INFECTIONS DURING AIDS, DIAGNOSTIC STRATEGY AND COST.

E. René A. Durrbach, R. Bouali, T. Chevalier, L. Geoffroy***, C. Roué**, T. Vallot, B. Régnier*, AG Saimot*, JL Vildé**, M. Mignon Hépato-Gastro-Entérologie - Inserm U.10 ; *Maladies infectieuses ; **Inserm U 239 Groupe Hospitalier Bichat - Claude Bernard 46 rue Huchard Cedex 18, France ***ARCHAM GR Santé 162 Av Lacassagne 69003 Lyon France. 75877 Paris,

Systematic and methodical explorations were prospectively performed in 119 AIDS patients and included first three stool bacteriological and parasitological examinations (S) ; second a duodenal fluid aspiration (DF) , and third endoscopic biopsies through gastroduodenoscopy and colonoscopy (EB). The direct cost was calculated according to the French Health Social Service cotation S=61$ X3 ; DF=128$; EB=807$. Several diagnostic strategies were simulated by changing the order of the 3 tests successively realized (S, DF, EB) and by introducing rules such as : to stop the investigation as soon as one test is positive. 76 explorations pointed out the presence of one or several germs totalizing 114 identified pathogens. 44 pathogens (39 %) were identified only by EB, 14 pathogens (12 %) only by S and 56 pathogens (49 %) by either S or DF or EB (36 Cryptosporidium (CRPT) 8 Giardia lamblia (GL), 12 Entamoeba histolytica (EH)). Sensitivity of S, DF, and EB was respectively for CRPT 75%, 47%, 11% for EH 100%, 28%, 25% and for GL 50%, 50%, 25% The best strategy (ST_1) was S, and then DF, and then if DF was negative EB. When using ST_1 the cost per patient decreased 29% (796$ vs 1121$ (direct costs)). Yet when dealing with polyinfected patients, ST_1 can lead to incomplete diagnosis : CMV 50%, HSV 31%, GL 12,6% (treatable pathogens), MAC 55% and CRPT 3% (non treatable pathogens). We show that a diagnosis strategy can reduce the cost of diagnosis concerning digestive infections in AIDS. If this strategy does not recognize 26% of the treatable germs in case of polyinfections, yet the diagnosis can be made later if symptoms go on in spite of a treatment fitting to the first identified pathogen.

M.H.P.5

HOSPITAL USE BY PWA'S IN N.Y., LOS ANGELES AND SAN FRANCISCO

Joanne Green, M. Leigh, H. Wintfeld
New York University Medical Center, New York, NY, USA

Objective. To describe patterns of hospital use by persons with AIDS/HIV in the three U.S. cities with greatest AIDS prevalence.
Methods. Analysis of all hospital discharge records for New York and California that were coded for AIDS/HIV related illness.
Results and Conclusions. Most of the acute care for AIDS in all three cities was heavily concentrated among a small proportion of hospitals. In New York, 1 hospital had 8% of the states entire AIDS census during 1983-1986 and just 14 hospitals had half the state's AIDS census. Among pediatric AIDS cases 1 hospital carried 14% and 6 hospitals had half the state's census. In Los Angeles, while 175 hospitals saw at least 1 case of AIDS, 1 hospital handled 15% of the city's census and 6 hospitals carried half the census. One LA hospital saw half the pediatric AIDS census. In San Francisco, 1 hospital handled 22% while 4 hospitals carried half the census.

Overall average length of stay (ALOS) for AIDS cases was highest in NY and considerably lower in both LA and SF (See Table). ALOS declined from 1983 to 1986 by 26% in SF and NY, and by 7% in LA. Stays lasting one week or less made up 33% of stays in NY, 45% in LA, and 44% in SF. The high ALOS in NY was skewed by many very long stays. There were 110 hospital stays for AIDS over 6 months long in NY, but only 4 in LA and 3 in SF. In NY, 8.2% of stays lasted over 50 days compared with just 2.1% in SF and 2.5% in LA. Removing these very long stay 'outliers' substantially reduces ALOS differences among cities. While NY's ALOS for AIDS was 61% higher than SF's, it was only 31% higher when stays over 50 days were removed.

	ALOS - ALL AIDS CASES				% DECREASE IN ALOS	ALOS WITH 'OUTLIERS' REMOVED
Area	1983	1984	1985	1986	1983-86	1986
NEW YORK	26.2	22.1	21.1	19.5	26%	14.7
SAN FRANCISCO	16.3	13.2	12.4	12.1	26%	11.2
LOS ANGELES	13.5	13.9	13.1	12.6	7%	11.2

M.H.P.6

COSTS AND CHARACTERISTICS OF OUT-OF-HOSPITAL PROGRAMS FOR PERSONS WITH AIDS IN SAN FRANCISCO, 1985-88

Stern, Adam C.; Amory, J.; Bala, M.; Hernandez, S.; Rutherford, G.; Department of Public Health, San Francisco, CA, USA.

Objective: To analyze costs and characteristics of out-of-hospital programs for persons with AIDS (PWAs) in San Francisco.
Methods: We collected data on 7 out-of-hospital services provided to PWAs in San Francisco during the period July 1, 1985 - June 30, 1988. We evaluated the programs on the following criteria: number of clients, cost per client, expenditures per living PWA (adjusted for reporting delays), average length of stay, and sources of financial support.
Results: From FY 1985-86 to FY 1987-88, annual expenditures for all 7 programs increased from US$2.9 mil. to US$5.2 mil., and the proportion privately funded increased from 30% to 42%. Annual expenditures per living PWA declined from US$3,251 to US$2,477. Characteristics of the programs for FY 1987-88 were:

Program	Clients	Cost/Client	ALOS(days)
Homecare	425	US$6,735	71
Emergency Housing	56	2,404	42
Residential Flats	99	7,169	172
Emotional Support	1,085	435	n/a
Practical Support	653	549	n/a
Social Service Advocacy	1,688	212	n/a
Patient Counseling	652	414	n/a

Conclusions: Expenditures for out-of-hospital programs for PWAs in San Francisco increased substantially during 1985-1988, with a larger proportion privately funded. However, expenditures per living PWA declined.

M.H.P.7

THE CONTRIBUTION OF PCP TO TRENDS IN AIDS HOSPITAL DISCHARGES AND AVERAGE LENGTHS OF STAY.

Hernandez, Sandra R.*; Strychaz,F.**; Rutherford,G.*; Baskett,L.**; Stern A.*
*Department of Public Health, San Francisco, CA; **West Bay Hospital Conference, San Mateo, CA, USA.

Objective: To evaluate the contribution of Pneumocystis carinii pneumonia (PCP) to declining average lengths of stay (ALOS) and declining average daily census (ADC) of hospitalized AIDS patients in the San Francisco Standard Metropolitan Service Area (SMSA).
Methods: We compared acute hospital discharges and average lengths of stay (ALOS) for AIDS patients discharged with a primary diagnosis of PCP and those discharged with other AIDS-related diagnoses from 1984-1987. Discharge data included are non-federal acute-care hospitals in San Francisco, San Mateo, and Marin Counties.
Results: The contribution of PCP to all AIDS discharges did not change from 1984 and 1987 but the ALOS of patients with PCP decreased more rapidly than ALOS patients without PCP.

	1984	1985	1986	1987
Discharges, % PCP	30.3	35.8	32.3	34.1
ALOS, PCP	16.2	12.9	13.7	12.3
ALOS, non-PCP	10.6	11.6	11.5	9.8

Conclusions: The decreasing ALOS and ADC for hospitalized AIDS patients in San Francisco SMSA can be primarily accounted for by shorter ALOS for PCP patients.

M.H.P.9

HOSPITAL USE BY A POPULATION-BASED COHORT OF AIDS PATIENTS.

Hulman, Sharon J; Modesitt,S; Klockner,R; Bennett,D; Fleming,D.
Oregon Health Division, Portland, Oregon, U.S.A.

Objective. To accurately determine statewide hospital use among AIDS patients by following all cases in a statewide, population-based cohort.
Methods. We follow all AIDS cases detected by active AIDS surveillance in Oregon who remain in the state for follow-up medical care. At six month intervals, we review each patient's medical record and abstract information about every hospitalization requiring at least an overnight stay.
Results. Records were available for 381 (94%) of the 407 Oregon AIDS cases diagnosed between 1/1/81 and 5/30/88. During the cumulative 3,965 case-months of follow-up, these 381 patients were hospitalized 783 times for a total of 8,240 days. Including initial (diagnostic) admissions, AIDS patients spent 6.8% of their time hospitalized. Admissions averaged 10.5 days each. Intensive care unit (ICU) days comprised 4.6% of all inpatient days; 83% of all ICU days occurred within the first 3 months of diagnosis. Among all patients, the median number of days spent in the hospital during the year following diagnosis has remained constant at between 7 and 8 from pre-1985 through 1988. By 12/88, 240 (63%) of the 381 patients had died. The total inpatient days among cases that had died averaged 30. This total was unrelated to length of survival after diagnosis by linear regression (total hospital days for those surviving 1-3 month, 26 days; 4-6 months, 23 days; 7-9 months, 38 days; 10-12 months, 30 days; 13-18 months, 32 days; 19-24 months, 25 days; more than 24 months, 34 days). The percent of time spent in the hospital was inversely associated with length of survival (1-6 months, 53%; 7-12 months, 12%; > 12 months, 5%; p=.0001 by linear regression).
Conclusion. In this cohort of AIDS patients, hospital use has been constant over time. Admissions have been short and relatively infrequent. Contrary to expectations, increased length of survival has been associated with more hospital-free days rather than more hospitalizations.

M.H.P.11

LA FREQUENTATION HOSPITALIÈRE LIÉE AU VIRUS DE L'IMMUNODEFICIENCE HUMAINE (VIH)

Jestin Christine*; Nadal J M*; Vidal-Trecan G**; Morel B*; Choquet O*; Chevalier J**
*Ministère de la Solidarité, de la Santé et de la Protection Sociale, Paris, France **Direction du Plan - Assistance Publique de Paris, Paris, France

Objective. Mesurer un jour donné l'activité hospitalière liée aux patients infectés par le VIH et en suivre l'évolution dans le temps.
Methodes. Une enquête nationale transversale semestrielle recense "un jour donné" les patients déjà connus comme infectés par le VIH 1) en fonction du stade de la maladie 2) en fonction du type de recours aux soins.
Resultats.

	patients recensés	asymptomatiques	formes mineures	SIDA avérés
9 décembre 1987	1 780	23%	37%	40%
8 juin 1988	1 871	19.3%	34%	46.7%

De décembre 1987 à juin 1988 l'augmentation totale des cas présents est de 5%. Elle porte sur les SIDA avérés (+ 25%), les formes mineures restent stables et les porteurs asymptomatiques diminuent de 13%. La diffusion des malades sur le plan géographique est très faible (70% des malades concentrés sur deux régions). Le champ des hôpitaux concernés reste stable. Deux malades sur trois sont hospitalisés (80% des SIDA) les autres sont vus en consultation. L'évolution observée porte sur l'hospitalisation de jour (40% des formes mineures). 84% des patients ont recours aux services de médecine générale et de spécialités médicales.
Conclusion. La répétition semestrielle de cette enquête fournit d'excellents indicateurs pour apprécier les sollicitations du système de soins par la pathologie à VIH et adapter les structures en fonction de son évolution.

M.H.P.8

COSTS OF HOSPITAL CARE FOR PATIENTS WITH HIV INFECTIONS

Borleffs, Jan C.C.; Jager, J.C.*; Geels, R.M.A.; Jong, J.T.L.*; Musch, C.K.; Poos, M.J.J.C.* et al.
University Hospital Utrecht, The Netherlands and *National Institute of Public Health and Environmental Protection, The Netherlands.

The implications of AIDS for health care are unknown. Precise data on the utilization of health care facilities and the allied costs, and efficiency and effectiveness of hospital care are not available, mainly due to the absence of suitabale methods for registration of demographic, medical and financial data of individual patients in hospitals. For this reason we developed a system which enables a detailed collection and analysis of data. The application of this system in 40 patients with HIV infections treated in our hospital between January 1, 1987 and July 1, 1988 showed that the mean yearly costs of in- and outpatient treatment of a patient with AIDS (CDC IV) were $ 20,000; those of treatment of patients with other HIV infections (CDC II-III) ranged from $ 1,700 to 2,500. Comparison of the mean costs for patients who died in that period with those for patients who did not, revealed that patients deceased because of AIDS would have costed $ 40,000 yearly and those with AIDS who were alive at July 1, 1988 $ 15,000. These figures only concern costs of hospital care for these patients. Other costs, such as those of procedures for prevention of HIV transmission, are not included. By the time of the conference the data will be updated. In addition, underlying diagnostic activities and treatment patterns will be described.

M.H.P.10

OUTPATIENT TREATMENT OF AIDS: A VIABLE ALTERNATIVE THAT DEMONSTRATES SIGNIFICANT COST SAVINGS

Liekweg, Richard; Dideriksen, P.; Adinolfi, A.; Bartlett, J.A. Duke University Medical Center, Durham, North Carolina, U.S.A.

OBJECTIVE: To compare the per diem charge of inpatient vs. outpatient treatment of AIDS patients with an opportunistic infection.
METHODS: Twelve patients were grouped according to opportunistic infection with 4 classified as inpatient/outpatient. PCP- (2 inpatients/2 outpatients); CMV- (3 inpatients/2 outpatients); wasting- (1 inpatient/2 outpatients); lymphoma- (1 inpatient/1 outpatient); meningitis- (1 inpatient/1 outpatient). Hospital days and inpatient charges per admission, and outpatient clinic charges and home health care charges per visit were collected over eight months. Average inpatient and outpatient per diems were calculated. Ten additional patients will be added as charges are posted and billed.
RESULTS: Average inpatient per diem for PCP was $1023 x 18 hospital days. Average out patient per diem was $157 x 23 clinic /or home health visits. CMV averaged a $615 inpatient per diem x 13 hospital days. Outpatient averaged 30 clinic /or home health visits x per diem of $242. Average inpatient per diem for wasting was $609 x 31 hospital days. Out patient cases averaged 17.5 clinic /or home health visits at $147 average per diem. Lymphoma was $891 inpatient per diem x 37 hospital days. Outpatient was $154 per diem x 34 clinic /or home health visits. Meningitis averaged a $584 per diem x 8 hospital days. Outpatient averaged $83 per diem x 56 clinic /or home health visits.
CONCLUSION: Our data show that individuals with complications of AIDS incur very different direct costs and per diem charges at home and in the hospital. Preliminary data strongly suggests that when outpatient therapy for these complications can be administered, per diem charges can be substantially reduced. These preliminary findings warrant further study, and have profound implications for health care policy development.

M.H.P.12

MEDICAL CHARGES AND HEALTH CARE UTILIZATION FOR PRIVATELY INSURED PATIENTS WITH HIV DISEASE IN CALIFORNIA

Durbin, Meg*, Bowen, B§¶, Maerki, S†, and Hudes, E¶
*University of California, San Francisco, U.S., §Kaiser Foundation Health Plan, ¶formerly with Blue Cross of California, Oakland, California, U.S., †Blue Cross of California, Oakland, California, U.S.

Objectives: To develop methods for identifying patients with HIV disease through insurance billing claims and to describe their total and estimated lifetime charges and distribution of health service utilization.
Methods: A major claims file of Blue Cross of California was screened between 1/85 - 3/87 for persons with HIV disease. Charges and utilization were analyzed for those with specific HIV diagnostic codes and for those with prominent HIV manifestations meeting specific age, sex, and reporting criteria. Kaplan-Maier lifetime cost estimates were also generated for all diagnostic groups except ARC.
Results: Of the 274 subjects identified, mean age was 39 years; 97% were male. Mean followup was 10 months, with 68% alive at study conclusion. Forty-three % had PCP. Mean charges were $19,000 for survivors v. $52,000 for those who died. The deceased were in hospital 3 times longer than survivors (29 days v. 10 days); their estimated lifetime charges were $79,000. Among all patients, hospital charges represented 62% of the total bill. Among those hospitalized, the highest charges were room and board. Among those not hospitalized, professional fees were highest. Among PCP patients, pharmacy charges increased from 9% for those diagnosed in 1984 to 26% for those diagnosed in 1987. Among the deceased, 81% of total charges accrued in the last 6 months of life, 66% within the last 3 months. Independent variables associated with higher medical charges for all patients included: death, PCP diagnosis, length of followup, total hospital days, later year of diagnosis.
Conclusions: Identifying expenses of persons with HIV disease through insurance billing systems includes outpatient costs potentially missed in hospital based reports or those relying on patient recall. We report charges comparatively low for survivors. But the strong association of charges with the terminal phase of HIV illness underscores the importance of reporting estimated or true lifetime charges (from diagnosis until death) rather than observed charges which include patients still alive. Unlike prior results from California, regional differences in charges are not explained exclusively by different hospitalization patterns in our population.

M.H.P.13

IMPLICATIONS OF PROPHYLACTIC AEROLSOLIZED PENTAMIDINE FOR THE DIRECT MEDICAL CARE COSTS OF AIDS

Gluck, Michael E., Chaisson, R., Johns Hopkins University, Baltimore, Maryland U.S.A.

Objective: To compare the health care costs of a cohort of 70 persons with AIDS (PWAs) receiving aerolsolized pentamidine as a prophylaxis against pneumocystis carinii pneumonia (PCP) with a comparison group of PWAs not receiving pentamidine.
Methods: Both treatment and comparison groups receive their primary care through the Johns Hopkins Hospital AIDS Services. The comparison group is stratified by length of time since diagnosis of AIDS and principal opportunistic infections in order to make it comparable to the group receiving pentamidine. Using chart abstraction, hospital billing records, established ratios between charges and costs, and average allowed Blue Cross professional fees, both groups are followed over the same six month period (or until death). For both inpatient and outpatient services, we calculate: (1) the costs of providing the pentamidine treatment, (2) the costs of treating PCP in the two groups, and (3) total direct health care costs in the two groups. The paper also discusses the cost implications of providing aerolsolized pentamidine in settings other than ambulatory hospital clinics.
Results and Conclusions: Because the analysis is currently underway, results will not be available until April 1989.

M.H.P.14

THE COSTS OF TREATING AIDS IN A RURAL SETTING

Waivers, Leo; Busher, J.T.; Rumley, R.L.; Adams, H.G.
East Carolina University School of Medicine, Greenville, NC, USA.

Objective. To determine the costs of inpatient and hospital outpatient care of AIDS patients in a rural area with low HIV prevalence.
Methods. We examined the hospital charge records for 16 patients treated from 8-Mar-84 to 16-Jul-88.
Results. There were 65 hospital admissions with an average length-of-stay (LOS) of 14.6 days and a median LOS of 9 days. Average cost per day of admission was $624. Pathology and pharmacy accounted for 24% and 23% of these charges, respectively. The average cost per hospital outpatient visit was $773 with 26% and 30% of these charges generated by pathology and pharmacy, respectively. The average annualized cost per patient was $38,271. Medicaid patients accounted for 63% of the total charges ($430,485 of $678,527), but 93% of the nonreimbursed charges ($181,898 of $194,714). The average loss per Medicaid patient was $20,210 (42% of charges billed), whereas for self-insured patients, the average loss was $1830 (5% of charges billed).
Conclusion. Our LOS and costs per patient are lower than reported in areas of higher prevalence. This may be due to several factors, including lower hospital charges in a rural area and higher utilization of outpatient services. Attempts to further reduce the costs of care in our facility should be directed towards more efficient use of pathology and pharmacy services. Inadequate Medicaid reimbursement for patients with AIDS is a significant financial burden for our health care facility.

M.H.P.15

L'HOPITAL ET LA CONSOMMATION MEDICALE DES PATIENTS INFECTES PAR LE VIH

Bez, Gabriel*; Petit, F.*.
*Ministère de la Santé, Paris, France.

Objectif. Connaître la structure des dépenses médicales directes et la formation des coûts à l'hôpital.
Méthodes. L'évaluation de ces coûts repose sur le recensement et la valorisation des prescriptions réalisées au cours de 5000 séjours hospitaliers liés au VIH.
Résultats.

Stades de la pathologie / Type de consommations	Biologie	Examens	Médicaments	Total
Asymptomatiques	14 %	2 %	0 %	16 %
Formes mineures	19 %	3 %	4 %	26 %
Sida	24 %	8 %	26 %	58 %
Tous stades confondus	57 %	13 %	30 %	100 %

Exprimé en journée, le coût des dépenses médicales est de 715 F pour les porteurs sains, 600 F pour les formes mineures et 510 F pour les sidéens. En revanche, le coût des séjours est de 1960 F pour les asymptomatiques, 4160 F pour les sidéens et 2300 F pour les formes mineures. Le bilan.moyen coûte 1850 F.
Conclusion. Cette étude met en évidence l'importance de la charge hospitalière des malades séropositifs non atteints de Sida avéré, le rôle essentiel de la biologie dans la constitution des coûts et les effets positifs d'une organisation hospitalière souple.

M.H.P.16

Health Care Costs for AIDS Patients in Saskatchewan.

Conly, John; Shafran, S.; Browne, K.
University of Saskatchewan, Saskatoon, Saskatchewan. CANADA

Objective: To obtain detailed and specific health care costs for the treatment of AIDS in Saskatchewan.
Methods: A detailed review of the medical records was possible for 19/21 AIDS patients. Physician visits, procedures, medical imaging and lab tests were assessed according to current billing codes. Hospital costs/patient day were based on the current per diem costs for medical patients at University Hospital. Medication costs were estimated by tabulating the active number of dose/drug combinations.
Results: Nineteen male patients 31(22-63) years [median (range)] of age were diagnosed as AIDS between April, 1985 and February, 1988. The 12 deceased patients lived 268(0-580) days after diagnosis, were admitted 4(1-6) times to hospital for 62(1-148) days for a total cost per patient of $33,039 ($2768-$64961). The 7 surviving patients have lived 360(186-551) days since diagnosis have been admitted 2(0-7) times to hospital for 25(0-86) days for a cost per patient of $11115(0-39410). The total cost per patient was $28759 of which fees to physicians were 6.8%, laboratory tests 21.6%, medications 6.7% and medical imaging 3.8%. The average medical costs per inpatient day were 3.74 times ($120.7 vs $32.32) greater for AIDS patients than the average medical patient. In-patient costs accounted for 94% of the total cost.
Conclusions: Costs of care for AIDS patients in Saskatchewan are substantial. Effective strategies for cost reduction include improved utilization of outpatient facilities and hospice/home care.

M.H.P.17

RESOURCE USE, CHARGES, AND MORTALITY FOR AIDS PATIENTS WITH PNEUMOCYSTIS CARINII PNEUMONIA (PCP)

CL Bennett, JR Garfinkle, S Greenfield, D Draper, W Rogers, WC Mathews, DE Kanouse. RAND Corporation, Santa Monica, CA; UCLA School of Medicine, LA; Shared Medical Systems, Malvern, PA and UCSD School of Medicine, San Diego, CA, U.S.A.

Objective: To evaluate variations in resource use, charges, and in-hospital mortality for patients (pts) with HIV-related PCP infection.

Methods: Computerized longitudinal patient records of 200,000 discharges between 10/86 and 10/87 were evaluated; 257 pts with PCP from 15 hospitals in metropolitan areas of California were identified.

Results: No significant variations in resource use or total charges were noted between the group of 218 pts receiving care at seven high-AIDS-familiarity hospitals (≥30 AIDS discharges/10,000 general discharges--hi-fam GP) relative to the 37 pts at eight low-AIDS-familiarity hospitals (≤30 AIDS discharges/10,000 general discharges--lo-fam GP) in terms of: days (13.2 vs. 15.4); ICU days (2.3 vs 2.1); frequency of ICU use (21.2% vs. 19.4%), prior emergency room use (37.2% vs. 36.0%); bronchoscopy use (71.7% vs. 64.3%) and total charges ($21,348 vs. $20,946), respectively, (p = NS). Severity of illness markers between the two groups were not significantly different (using a staging system of Turner et al., 1988). In-hospital mortality for hi-fam GP was significantly lower than that for lo-fam GP (12.2% vs. 33.3%, p = .004).

Conclusions: Pts in the lo-fam GP did not differ in severity or resource use from those in hi-fam GP. However, they were more likely to die in-hospital. Outcome differences might be due to variations in process of care.

M.H.P.18

AIDS HEALTH CARE IN THE U.S.: CHARACTERISTICS OF THE PATIENTS AND THE HOSPITALS WHO TREAT THEM

Andrulis, Dennis*; Weslowski, V.* and Hintz, E.*.
*National Public Health and Hospital Institute, Washington, D.C., United States.

Objective. The National Public Health and Hospital Institute conducted a survey to examine AIDS treatment in U.S. hospitals in 1987
Methods. The survey was disseminated to member hospitals of 4 associations: the Association of American Medical Colleges's Council of Teaching Hospitals, the Nation Association of Public Hospitals, the National Association of Childrens Hospitals and Related Institutions, and the National Council of Community Hospitals. The survey requested information on hospital utilization, demographic and risk group characteristics of persons with AIDS (PWAs), financing, discharges and organisational characteristics.
Results. Fifty-five percent (341/623) of the hospitals responded, reporting information for 14,000 AIDS patients and 382,000 inpatients days. Analysis of the information examined similarities and differences of hospitals by ownership, region, number of AIDS patients diagnosed, city, location and other factors.
Conclusion. Conclusions consider how the burden of care, treatments and sources of support differ among institutional groups and areas of the country. The report also considers implications for AIDS care in the U.S.

COUT PAR PATHOLOGIES DUES AU VIH ET TRAITEES A L'HOPITAL

BOULAY Fabrice, GAUTIER D., PETIT F., LOUENOT E., SALIN J., SEZ G.*
* Direction des Hôpitaux, Ministère de la Santé, Paris, France.

Objectifs : Analyser et comparer les coûts hospitaliers des pathologies dues au VIH.
Méthodes : Un fichier de résumés médicaux et de consommations (actes biologiques-LAB, actes non biologiques-IMA, médicaments et produits sanguins-PSA) a été constitué pour 4236 hospitalisations réalisées en 1988 dans 16 centres de référence. Les diagnostics principaux des séjours (pneumocystose aigue, Sida avec complications multiples ...) définissent les types de pathologies étudiées. Les coûts sont la somme des dépenses médicales directes (consommations LAB-IMA-PSA) et du reste des dépenses journalières liées à l'hospitalisation (1300 F/j).
Résultats : Coûts par séjour-malade en Milliers de Francs (KF) : 1000 F = US $ 159

	Toxopl.	Pneumo.	Mult.	Cach.VIH	Enceph.VIH	Kaposi	Hémato.	Bilan
N	44	82	81	76	23	31	110	919
DMS	29.6	32.7	20.8	31.8	20.0	12.7	2.8	1.7
KF LAB	3.9	4.3	3.1	2.0	3.0	2.3	1.2	1.8
KF IMA	2.5	1.8	1.2	1.0	1.7	0.9	0.1	0.1
KF PSA	3.6	5.7	2.9	1.6	1.4	2.5	0.9	-
KF TOT	56.3	45.8	38.3	37.3	36.2	24.8	6.3	4.5

DMS:durée moyenne de séjour. Toxopl:toxoplasmose. Pneumo:pneumocystose. Mult:Sida+complications multiples. Cach:cachexie VIH. Enceph:encéphalopathie VIH. Hémato:formes mineures immunohématologiques. Bilan:séjour pour "bilan" de sujets asymptômatiques ou lymphadénopathiques. Les coûts varient selon les pathologies associées : pneumo. + autres complications Sida(N=31, DMS=38.1, 66.4KF). pneumo. + autres infections (N=16, DMS=24.3, 47.1KF). pneumo. isolée (N=35, DMS=18.0, 34.0KF). Certains coûts sont majorés par quelques séjours inhabituellement longs: les toxopl. avec DMS entre 5 et 57 j. (N=34, DMS=20.3) ont un coût de 36.4 KF (-33 %). Ces coûts seront comparés à ceux de pathologies classées dans les mêmes Diagnosis Related Groups (DRG's).
Conclusion : De telles études permettent de décrire le mode de formation des coûts liés au VIH.

M.H.P.20

POTENTIAL IMPACT OF HIV IN THE LABOR FORCE OF THE FUTURE

Novello, Antonia, Wright, A.

National Institute of Child Health and Human Development
National Institutes of Health, Bethesda, Maryland 20892, U.S.A.

Objectives. To evaluate the potential impact of HIV infection and disease in persons currently aged 11-24 on the future labor force--the labor force participation rate, and worker-to-dependent ratio in the years 2010-2040.
Methods. Review of fertility rates, population and labor force participation trends and relevant projections will be utilized to provide a picture of the impact of HIV infection on the future labor force. The impact of changing variables such as increased mortality and morbidity due to HIV infection on the cohort of persons currently aged 11-24 will be interpolated and analyzed.
Results. A description of prospective outcomes, in this 11-24 year old cohort population, from best case to worst case scenarios will be presented, utilizing the variables of seroprevalence, morbidity and mortality. The potential economic impact of AIDS in the labor force, and on labor force participation and dependency ratios of the future will be depicted.
Conclusion. Prevention efforts need to be targeted to the 11-24 year old cohort. If AIDS is to make serious inroads in this cohort of people the potential for significant negative repercussion on the labor force and the economy of the United States in the period 2010-2040 will be apparent.

M.H.P.21

ROTS.QUALITY STANDARD OF CONDOMS BASED ON A RHEOLOGICAL MODEL.

Torres,José*; Anabitarte,H.*; Usieto,R.*; Noguera,E.*

*Comité Anti-SIDA,Spain

Objective:The actual standards(ISO,BS,AFNOR,UNE..)start from a model of 1960 and with the tecnological,sanitary and cultural changes(2nd sex.revol.).The criterion or requirement was:SECURITY,evaluating it with tests of mecanical resistance on break,tested with constant deformation;for the detection of leaks etc.,the scientific base was a model:"elastic body(HOOKE) together with an adequate testing plan.The appearance of HIV and his danger lead us to develop new methods with more realistic bases.Description:The standard ROTS (Rheological Quality Test System)starts from 2 criterions:SECURITY.SENSIBILITY. The scientific base starts from a new analogical model:visco-elastic body (HOOKE-NEWTON)and the valoration of break by propagation of chaps(criterion GRIFFITH) which is different to an elastic break.The evaluation of security is made with the Rheological Test(Pat.met.) using impacts caused by shock-waves with water(non-constant deformation).The detection of leaks is realized by conductimetric. but with condom in tension,not like up to now(reposing). The sensibility is evaluated by the 1st module at 100% (G100),rejecting lots for defects in sensibility,as this fact interests the consumer.The testing plan is highly rigorous:AQL is 0,1% in spite of the 0,4% used in actual standards.
Conclusions: ROTS Standard permits to increase fiability of a condom by better analogy between the test methods and the real use by the consumer, with the objective to optimize the function of prophylaxis against HIV and as contraceptive barrier.

M.H.P.22

BARRIER PROPERTIES OF NATURAL SKIN CONDOMS TO SMALL PARTICLES

White, Rick; Harrison, M. and Tobin, F.
London International Group, Research and Development, Cambridge, U.K.

Objective. To discover why high MW Dextran passes through natural skin condoms and microspheres do not, when both are claimed to contain particles 80nm in diameter i.e. similar to HIV at 90-120nm.
Method. The barrier properties of the condoms were assessed by placing aqueous dispersions of test particles inside a condom, which is then partly immersed in a beaker of water, and determining whether any of the particles could be collected on the outside. Samples of Dextran passing through the condom were collected and analysed using a calibrated GPC which measures molecular size.
Results. GPC Analysis of the Dextran as supplied showed that it contained a very wide range of particle sizes. The sample of Dextran collected, that had passed through the condom, contained particles considerably smaller than HIV. SEM pictures showed the polystyrene microspheres had a very narrow range of particle sizes.
Conclusions. Unlike polystyrene microspheres, Dextran contains a wide range of particle sizes. The bulk of the Dextran does not pass through the natural skin condoms, but fractions containing smaller particles permeate through. This produces the apparent discrepancy with the data from polystyrene microspheres since the latter is essentially a mono-dispersion. Therefore, natural skin condoms are probably a barrier to HIV since the virus is substantially larger than the largest model particle shown to go through.

M.H.P.23

EFFECT OF OZONE ON THE PHYSICAL PROPERTIES OF CONDOMS

Potter, Bill; White, R.; Williams, P.; Armstrong, J. and Marriott, T.
London International Group, Research and Development, Cambridge, U.K.

Objective. To determine the effect of ozone exposure on both packaged and loose condoms.
Method. A range of packaged and loose condoms were exposed to two ozone regimes; 300 parts per billion (ppb) of ozone for 72 hours and 5000ppb of ozone for 168 hours. Condoms were burst tested before and after exposure.
Results. The burst volumes and burst pressures of packaged condoms were unaffected by exposure to ozone. Loose condoms were very brittle after exposure and untestable.
Conclusion. Provided that condoms are retained in good quality packaging prior to usage, their performance is not diminished by exposure to ozone.

M.H.P.24

CONDOMS: A COMPARATIVE STUDY OF MECHANICAL STRENGTH, HUMAN RATING ABILITY AND IN VIVO CONDOM USE

Taylor, Clark*; DeCecco, J*; Bao, D.**; Hirsch, R.**; Sutton, L.***; Loures, D.***
*SFSU, Center for Research and Education in Sexuality, San Francisco, Calif., USA, **Stanford Univ., Stanford, Calif., USA, ***The Institute For Advanced Study of Human Sexuality, S.F. Calif., USA

Objective. To compare mechanical with human efforts to rate the reliability of 7 condom brands and analyze the results with the aid of sexologists and condom video archives.
Methods. Seven brands of condoms were tested and subjectively rated by 49 college students. The same brands were then mechanically tested using ASTM and ISO standards. Similarities and differences in mechanical and human ratings were interpreted by reviewing 70 hours of human sexual condom patterning video tapes and discussing the comparative rating results with experienced sex therapists and educators.
Results. There are crude similarities between mechanical and human measurements of condom reliability. However, more significantly, many factors which strongly effect human assment and rating choices are not taken into account by laboratory tests. Thus users, manufacturers and laboratory scientists make serious, unnecessary errors in assessing condom reliability.

M.H.P.25

EVALUATION OF A NEW FEMALE CONDOM FOR VIRUS PERMEABILITY.

Drew, W. Lawrence*; Blair, M.*; and Conant, M.**.
*Mount Zion Hospital and Medical Center, The Biskind Pathology Research Laboratory, San Francisco, California, USA,**The University of California, San Francisco, California, USA.

Objective. To determine if a new female condom is permeable for viruses.
Methods. A new barrier contraceptive device for internal use by women is undergoing development in the United States. The "female" condom, designated WPC-333 (Wisconsin Pharmacal Company, Jackson, WI), consists of a soft, loose-fitting polyurethane sheath and two diaphragm-like, flexible polyurethane rings. One ring lies inside the sheath and serves as an insertion mechanism and internal anchor. The other ring remains outside the vagina once the device is inserted, protecting the labia and the base of the penis. We have developed an artificial intercourse model for this condom and tested it for permeability to viruses in triplicate as follows:

For each trial 2 ml of virus suspension is placed inside a female condom. This condom is placed inside a second female condom which contains 2 ml of tissue culture medium. A 35 cc plastic syringe case is inserted into the inner condom to serve as a penis. To simulate trauma associated with sexual intercourse, the entire apparatus is placed into a close-fitting foam model which serves as a vagina and plunged up and down fifty times. CMV cultures were performed in diploid fibroblast cells and HIV cultures in normal human lymphocyte cultures stimulated with PHA.
Results. Neither virus leaked from the inner condom.
Conclusion. In a laboratory model simulating sexual intercourse a female condom is impermeable to CMV and HIV.

M.H.P.26

VINYL VERSUS LATEX GLOVES AS BARRIERS TO TRANSMISSION OF HIV AND OTHER VIRUSES IN THE HEALTH CARE SETTING

Zbitnew, A.; Greer, K.; Heise-Qualtiere, J. and Conly, J.;
Dept. of Microbiology, University of Saskatchewan, Saskatoon, Sask., Canada.

OBJECTIVE: To determine the permeability of 8 different glove types (7 latex and 1 vinyl) to three different sized viruses, Herpes simplex virus type 1 (HSV-1), Echovirus 9 (Echo 9) and Human immunodeficiency virus type 1 (HIV-1).

METHODS: Virus suspensions of HSV-1 ($10^{8}TCD_{50}/ml$), HIV-1 ($10^{5}TCD_{50}/ml$) and Echo 9 ($10^{7.5}TCD_{50}/ml$) were placed in an inverted glove finger from visually intact gloves immersed in sterile media in glass containers. Aliquots of 0.5 ml suspension were removed at 10 minutes, 30 minutes, 1, 2 and 3 hour intervals from outside and inside of the glove finger (positive control) and were tested in cell cultures for presence of virus. The experiments were repeated with Echo 9 after stretching of a glove finger for 18 hours.

RESULTS: None of the three viruses tested were recovered from the aliquots of suspensions from the outside of the inverted glove finger. All three viruses were recovered from inside of the glove finger (positive control).

CONCLUSION: Our data suggests that under the experimental conditions used, visually intact gloves which are used in our institution would act as effective barriers to transmission of viruses in a health care setting.

M.H.P.27

LEAKAGE OF VIRUS (BACTERIOPHAGE X-174) THROUGH STRESSED VINYL AND LATEX EXAMINATION GLOVES

Korniewicz, Denise*; B. Laughon*; H. Cyr**; D. Lytle** E.Larson*
*Johns Hopkins University, Baltimore, Maryland, USA, **Food and Drug Administration, Devices and Radiological Health, Rockville, Maryland, USA.

Objective. To compare stressed latex and vinyl examination gloves as barriers to viruses.
Methods. We tested leakage of bacteriophage ΦX-174 through examination gloves. Vinyl and latex gloves were stressed using a standardized set of manipulations designed to mimic activities performed during patient care. Four levels of stress were applied: full, partial, no manipulation (gloves donned and removed), and control (out of box), and gloves were tested for virus leakage blindly for each level of manipulation. One hundred ml of PBS containing 10^{5} - 10^{6} pfu/ml were poured into the glove. The gloves were then hung for 5 minutes and dipped into 100 ml of collection buffer for 5 minutes. The collection buffer was sampled using a standard coliphage plaque assay with E. coli C as the indicator strain.
Results. To date, 183 gloves, 92 vinyl and 91 latex, have been tested. Viral leaks were found in 44% of vinyl gloves (20 of 45) following full and partial manipulations as compared to 10% of latex gloves (6 of 63; Fisher's exact test, two-tailed; p = .0003).
Conclusion. These preliminary results on virus leakage through stressed vinyl and latex exam gloves are consistent with our results reported last year on leakage of bacteria, indicating more frequent leakage through vinyl gloves, particularly following manipulation.

Planning/Management

T.H.P.1

THE IMPACT OF CARING FOR A.I.D.S. PATIENTS ON THE WORKLOAD OF PRIMARY CARE PHYSICIANS IN A HEALTH MAINTENANCE ORGANIZATION

Coltin, Kathryn and Goldberg, J.
Harvard Community Health Plan, Boston, MA USA

Objective. To measure the clinical and administrative workload generated in one year by the average AIDS patient in an HMO, and to relate it to that of the average adult HMO member, for purposes of resource planning. Methods. The ambulatory health center and hospital utilization records of all diagnosed AIDS patients who received treatment at an HMO during its fiscal year 1988 (n=119) were analyzed, as were those of all adult HMO members (n>195,000) during the same period. Health center encounter rates were calculated by clinical specialty and type, as were the mean number of in-Plan lab and x-ray exams and new prescriptions. The mean number of acute and long-term hospital days were also calculated. All utilization figures are for the fiscal year ending September 30, 1988. Results. 92% of all AIDS patients treated during FY88 were males between the ages of 20-49. The ratio of face-to-face internal medicine visits in this group (13.08/pt) to those of the average HMO male member 20-49 (1.12/pt) was 11.7 to 1. Face-to-face visits accounted for only 36% of all internal medicine encounters for AIDS patients, with telephone encounters representing another 20%. Over 40% were administrative encounters, such as making referral arrangements and coordinating inhouse lab testing. AIDS patients received almost 20 times the number of lab tests and x-rays as the average adult HMO member and almost 10 times the number of new drug prescriptions. The ratio of acute inpatient medicine days for AIDS patients (13.92 days/pt) to that for the average adult member (0.91 days/ pt) was 150 to 1. The average AIDS patient received 8.1 months of care during FY88. Conclusions. AIDS patients consume significantly more primary care M.D. time than the average HMO adult. This should be considered in planning M.D. to population ratios in settings having high numbers of AIDS patients.

T.H.P.3

DEMOGRAPHIC, UTILIZATION, AND REIMBURSEMENT DATA FOR AIDS PATIENTS IN 21 U.S. CITIES

Matheny S.; Hostetter, C.; Paquin, N.; McMenamin D., Health Resources and Services Administration, Public Health Service (PHS), Department of Health and Human Services, Rockville, Maryland, U.S.A.

Objective Over $29 million has been awarded by the U.S. PHS to fund Service Demonstration Projects in 21 high AIDS prevalence U.S. cities. Data on client demographics, service utilization, and sources of reimbursement for care have been received. This is the only source of such data to date for different areas of the U.S.
Methods Preliminary data for 20 projects have been analyzed, comparing demographic profiles of clients with profiles of the national AIDS population. Primary sources of reimbursement were analyzed to assess regional or other variations.
Results Demographic data provide current information on age, sex, race, & transmission category for project clients diagnosed as asymptomatic HIV seropositive, AIDS, & other symptomatic HIV infection. The data confirm that these projects are serving a disproportionately high number women, & ethnic minority individuals as compared to the national profile of patients. Reimbursement data reveal a high reliance on public resources, with private insurance covering primarily hospital & hospice services. Federal and state funds constitute the largest source of reimbursement for ambulatory, home health, & subacute skilled nursing services. Local & other funds are the major source of support for residential services.
Conclusion Client profiles & reimbursement sources show that disproportionately high numbers of women, children, & minorities are utilizing these projects & public sources of reimbursement predominate.

T.H.P.5

SPECIFIC AND SENSITIVE ESTIMATES OF ACUTE CARE HOSPITAL STAYS ASSOCIATED WITH HIV IN NEW YORK

DiFerdinando, George Jr. ; Kaufman, G.
New York State (NYS) Department of Health, Albany, NY, USA.

Objective. Create and compare upper and lower bounds of total hospital discharges associated with HIV infection in NYS using available discharge data abstracts (DDA). Methods. With DDA for all acute hospital stays in NYS, 1981-87, patients 18-44 years, the specific method counts DDA containing diagnoses (ICD-9-CM codes : 042-049, 795.8, 279.10, 279.19, 279.30, or 136.3) HIV specific (HIVSD). The sensitive method designates all infections, malignancies, and/or CNS disease in the 1/88 ICD-9-CM AIDS revision as HIV related (HIVRD). This latter "worst case" estimate attributes all increase in DDA with any HIVRD to HIV infection, whether or not an HIVSD is on the DDA; it also includes DDA with an HIVSD without any HIVRD.

Results.	1984	1985	1986	1987
Discharge Estimate				
HIVSD (Specific)	3140	6204	10846	15734
Worst Case(Sensitive)	9398	13648	20824	25318
Ratio	3	2.2	1.9	1.6

DDA with an HIVSD but no HIVRD increased from 1984 (22%) to 1987 (28.9%).
Conclusion. The worst case estimate suggests that there are many more HIV related discharges than currently estimated. Upper and lower bound estimates of acute care hospital discharges in NYS are converging over time. Increasing HIVSD DDA with no HIVRD suggest there are other conditions, either not coded and/or not in the ICD-9-CM AIDS codes, that are responsible for such hospitalizations for HIV infected persons.

T.H.P.2

HOSPITAL-BASED AIDS VOLUNTEER PROGRAM IN HEALTH MAINTENANCE ORGANIZATION (HMO)

Casado, Deborah, M.S.W., A.C.S.W. and Stone, Judi, M.S.W., Kaiser Permanente, Dept. Social Work Services, 930 Presidio, San Francisco, California 94115-3395 U.S.A.

Objective. To describe the design and operational structure of an AIDS volunteer program in the largest HMO in U.S.
Methods. An AIDS volunteer program designed to provide practical and emotional support to our in-patient AIDS population. Performed internal needs assessment and studied other programs in community; recruitment of HIV-sensitive personnel to staff program; established policies; developed manual for the program; provided 2.5 day HIV-sensitive training; weekly scheduling of volunteer staff support group meetings; and developed training video.
Results. HIV volunteer program now institutionalized at Kaiser Permanente. Results are: coordination of program through social work services for supervision and support; coordination through volunteer department for administrative support; and a model program recognized in San Francisco and external communities.
Conclusion. A hospital-based AIDS volunteer program providing a new adjunct service to a hospital-based AIDS unit with evaluation from providers, patients, families, and volunteers.

T.H.P.4

DEVELOPMENT OF A SEVERITY INDEX FOR USE WITH STATEWIDE MEDICAID AIDS PATIENT FILES

Turner, Barbara; Alemi, F. and Markson, L.
Jefferson Medical College, Philadelphia, PA. U.S.A.

Objective: To summarize the judgments of 6 national AIDS experts convened to develop a severity classification model for AIDS to be applied on statewide Medicaid files in New York and California.
Methods: Before the meeting, experts generated lists of major factors that could influence survival of AIDS patients. These factors were organized by affected organ system and by patient/treatment characteristics. In the meeting, the experts reviewed and finalized the list of factors. AIDS case scenarios were created with randomly assigned composites of these factors. Panel members estimated survival times for 100 cases as well as for each of the factors used in the cases.
Results: Clinical indicators used in the severity model included: AIDS-defining diagnosis and duration since diagnosis, subsequent opportunistic and non-opportunistic infections and cancers grouped by organ system, assessment of the degree of organ compromise with these conditions, nutritional status, and drug treatments. Patient factors included: age, sex, race, risk group, and level of denial of disease. Treatment site factors included: type of hospital and follow-up care, level of experience treating AIDS patients at the site, and size of local AIDS population. Weighted utilities were used to determine the relative importance of each indicator in the model.
Conclusions: This model demonstrates a method of integrating a variety of data contained on Medicaid files to assess severity of illness in order to promote meaningful contrasts among groups of AIDS patients.

T.H.P.6

THE C-100 CLINIC: THE ESTABLISHMENT OF A PRIMARY CARE PROGRAM AT CHARITY HOSPITAL AT NEW ORLEANS, LOUISIANA.

Wisniewski, Ted; Louisiana State University, New Orleans, Louisiana, United States.

Objective: To describe the incorporation of a model HIV Primary Care program into a traditional teaching medical center at Charity Hospital at New Orleans, Louisiana, the oldest public hospital in the United States. Methods: Description of programs developed and analysis of impact on public/private health systems through providing services for over 1,000 patients at all stages of HIV-related illness seen since 6/18/87. Results: Delineate components of this model clinic, discuss its evolving relationship with two medical schools, multiple subspecialties, inpatient and outpatient systems; review links with case management and local community groups, public health and STD clinics, pediatric clinics, home care and hospice agencies, and demonstrate the primary care role in relationship to on-site AIDS Clinical Trials Unit (ACTU) and other research programs. Funded in part through federal (HRSA) and private (Robert Wood Johnson) grants, the clinic's central role in service demonstration projects will also be elucidated. Conclusion: This model primary care program exemplifies program development in one of the most economically depressed regions of the United States, incorporating funding from private and public sources on a local, state and national level.

The Economic Impact of AIDS

T.H.P.7

SCATTER BED VERSUS CLUSTER UNIT TREATMENT OF AIDS INPATIENTS. Fulop G, Strain J, Fahs M, Sacks H.
The Mount Sinai School of Medicine, NYC, USA.

Objective. The Presidential AIDS Commission commented on the need to compile data from hospitals using dedicated AIDS units and those using scattered placement with regard to quality of care and outcome. Many hospitals are converting beds to an AIDS unit without the benefit of cost and benefit analyses. This preliminary study describes the outcomes and charges of AIDS Unit (Cluster) and Scatter HIV inpatients.

Methods/Results. Cluster (N=23) versus Scatter (N=67) patients were studied at the Mount Sinai Hospital in NYC using the Utilization Information Service database over a 3 month period. Cluster patients were more likely than Scatter inpatients to be female (P<.06), have more consultations (P<.01), stay 33% longer in the hospital (p<.01), and have higher charges (p<.05) (room- $9,423 vs $6,493 , and services - $9,970 vs. $7,735). No differences in age, race, insurance, number of procedures, hospital acquired infections, death rate, and discharges home were observed.

Conclusion. This preliminary study observed a significantly prolonged hospital stay and increased charges for Cluster patients compared to Scatter patients without significant differences in mortality and discharges home. Prospective, cost-effectiveness studies of Scatter vs. Cluster units are required.

T.H.P.8

The Economic Impact of Early Intervention in HIV Disease
Peter Arno*; Shenson, D.*; Siegel N.**; Franks P.***; Lee P***; *Montefiore Med Ctr, Bronx, NY, USA,**Univ NC, Chapel Hill, USA, ***Univ CA, San Francisco, USA

Objective: To assess the economic magnitude of providing early intervention services in HIV disease.

Methods: The prerequisites of an early intervention strategy were assessed. The number of individuals requiring early intervention was determined for New York, San Francisco, and the United States. The economic costs for requisite services, including HIV-antibody testing; serologic monitoring; counseling; drug treatment; and primary medical care were estimated.

Results: Median estimated costs of early intervention beginning each year 1988-1991(expenditures in millions of dollars)

	1988	1989	1990	1991
United States	4,078	3,870	3,602	3,260
NewYork City	627	599	567	531
San Francisco	88	82	75	67

Conclusion: There is a "window of opportunity" for effective early intervention in HIV disease because the majority of infected individuals are approaching the symptomatic phase of illness. Planning for its implementation should begin immediately.

T.H.P.9

PATIENT PREFERENCE AND SATISFACTION WITH AIDS SERVICES
Pittman-Lindeman, Mary; Miller, D.; Hernandez, S.; Moss,A.*
Department of Public Health, San Francisco, CA USA - *University of California, San Francisco,U.S.A.

Objective: To evaluate the accessibility and quality of services available to persons with HIV infection in San Francisco in order to plan for future needs.

Methods: The authors will utilize a questionnaire and follow-up phone interviews with a sample of persons receiving one or more HIV-related services in San Francisco. Recruitment of persons to respond to the questionnaire will be 1) persons utilizing services at SFGH or other Department of Public Health service sites including substance abuse programs serving PWAs, will be asked to volunteer and 2) an ad will be placed in local newspapers. The initial questionnaire will be close-ended questions pertaining to prior utilization of services, housing and supports, perceived gaps or problems with services, preferred type of service provider, source of insurance/payments, socioeconomic data, and level of disability. The survey will be pretested with both providers and persons with HIV infections.

Results: Discussions about the long term needs of PWAs for planning purposes has indicated that the provider's opinion may vary from that of the patient. In some cases we believe that this may be due to a lack of information about the service and its availability. Some services have not been successful due to a lack of support from the person with AIDS.

Conclusion: In order to meet the needs of PWAs in the future in San Francisco, it is necessary to gather the direct input from persons utilizing the services. This information will ensure a responsive system of care.

T.H.P.10

HOSPITAL COSTS AND DRG REIMBURSEMENT FOR HIV ADMISSIONS.
Slim, Jihad*, Heidge, D., Perez, G. Johnson, E.S., Perez, E. Saint Michael's Medical Center, Newark, New Jersey, U.S.A.

Objective: To determine impact of DRG system and admitting service on hospital reimbursements.

Methods: Retrospective review of 1987 admissions coded as HIV disease. Total admissions listed as self-payers studied in detail as well as admitting service.

Results: Total of 326 patients comprised 403 admissions. Of these, 110 were listed as self-payers. 70% of admissions were to the Infectious Disease Service. Of the 110 self-payers, 64% not able to reimburse the hospital. This resulted in a $331,423 loss to the hospital. Only 13% of the Infectious Disease Service admissions with a Case Management System failed to reimburse as opposed to a 30% rate in the Medical Service group. Most of these latter admissions were emergency in nature.

Conclusion: Although losses occurred in the self-payer category, these can be minimized by prior infectious diseases and Case Manager involvement with a decrease in emergency type admissions.

T.H.P.11

SHIFTING TOWARDS AMBULATORY CARE OF AIDS PATIENTS - LESSONS FROM THE PCP EPIDEMIC.
Levitt, N; Montaner, JSG; Lawson, L; Sigurnjak, R; Malysh, L and Ruedy, J. AIDS Research Program, St. Paul's Hospital, University of British Columbia, Vancouver, BC, Canada.

OBJECTIVE. To describe the successful shift towards ambulatory care of patients with AIDS-related PCP.

METHODS. Data was obtained from the Medical Records Department and the Microbiology laboratory PCP surveillance records at St. Paul's Hospital (SPH). The following variables were collected on a quarterly basis for the 2 year period ending March 31, 1988:

I. Number of AIDS-related PCP cases diagnosed
II. Number of AIDS-related PCP cases admitted to hospital
III. Length of hospital stay of AIDS-related PCP cases.

RESULTS. The number of PCP cases diagnosed at SPH increased steadily from the from the 2nd quarter of 1986 (86/2) to the 2nd quarter of 1987 (87/2) (from 17 to 31 cases). Hospital utilization by PCP cases followed the same pattern (from 273 to 576 hospital days). At this time, a major effort was undertaken to encourage a shift towards ambulatory care of AIDS patients. This was generally facilitated by the opening of an HIV dedicated ambulatory care facility in mid May 1987 and specifically in the case of PCP, by the introduction of effective oral antimicrobials, the wider use of PCP prophylaxis and the availability of zidovudine. Although SPH continued to care for over 70% of all AIDS cases in the province, the number of PCP cases stabilized at 23 per quarter. Approximately 20% of them were successfully treated on an outpatient basis while the rest required hospitalization for varying periods of time. As a consequence, the hospital bed utilization over the last 3 quarters of the study, decreased to 250 days per quarter. Average length of stay per diagnosed case of PCP also decreased from 16.45 days (86/2 to 87/2) for the period to 11.20 days for the last 3 quarters of the study.

CONCLUSION. The present study demonstrates the feasibility for implementation of ambulatory care programs for specific groups of AIDS patients. This lesson from the PCP epidemic should be expanded to aid in the shift towards ambulatory care of AIDS patients in general.

* Supported in part by the National Health Research Development Program (NHRDP), Health & Welfare, Canada.

T.H.P.12

HEALTH CARE COSTS OF CLASS 4 HIV CARE IN AN HMO SETTING
Anderson, Elizabeth S.; Shields, A.; Revis, T.; Mehring, M.; Chi, Y.; Thompson, R.L., M.D.
Group Health Cooperative of Puget Sound; Seattle, Washington; U.S.A.

Objective: To identify the health care costs and service utilization of patients with CDC Class 4-HIV conditions from January 1987 to June 1988 at Group Health Cooperative (GHC), an HMO with comprehensive medical coverage.

Methods: A database tracking utilization and average costs was used to identify all care provided to a sample of 83 homosexual/bisexual males (mean age, 38 years) with CDC Class 4 HIV disease from January 1987 to June 1988. 86% (71) had an AIDS diagnosis; 14% (12) had other Class 4 HIV conditions e.g. ITP. Only months of care after an HIV diagnosis were studied. 88% (73) received AZT all or part of the time. Results were compared to an age and sex matched control sample randomly selected from all GHC enrollees.

Results: GHC's estimated annual costs for all services are $21,130/person for the AIDS sample; $640 for the control sample and $1,032/person for all GHC enrollees. In the HIV sample, costs were 55% inpatient, 7% primary care, 16% specialty care, 13% outpatient pharmacy, 4% laboratory, and 5% other. Assuming a survival range of 18 to 24 months, a range of diagnosis-to-death costs for PWA's is estimated at $31,700 to $42,300. Average length of hospital stay was 10.5 days (with a range of 1-80 days) comparable to the Washington State average of 11 days. GHC's primary care MD's manage HIV cases with specialty consultation as needed. Primary care utilization was 11 times greater than in controls. Eight specialties (infectious disease, pulmonary, oncology, radiation therapy, dermatology, ophthalmology, E.R. medicine, and surgery) were utilized to a greater extent than primary care.

Conclusions: Accurate information about the costs of AIDS care and utilization profiles are powerful tools for HMO's and hospitals to use in budgeting manpower and bed projections and long range planning, particularly when coupled with estimates of future caseloads.

Repercussions economiques du SIDA
The Economic Impact of AIDS

T.H.P.13 AN INTERDISCIPLINARY MODEL OF AIDS CARE IN A TEACHING HOSPITAL

Goldstone, Irene; Ruedy, J.; and McLeod, A.
St. Paul's Hospital, University of British Columbia, Vancouver, British Columbia, Canada.

Objective. To describe St. Paul's Hospital (SPH) AIDS Care Program. SPH is a 575 bed teaching hospital of the University of British Columbia.
Method. Since 1982 SPH has cared for 350 (12/88) AIDS patients, the majority of whom are from 6 general practitioners (GP's) associated with SPH. In 1984, recognizing the complex nature of AIDS, a senior medical sub-specialist was asked to establish and run an interdisciplinary AIDS Care Group. The Group has evolved to include: GP's and Specialist Staff, Head Nurses of the Medical Wards and AIDS Clinic, the Director of Medical Nursing, AIDS dedicated Social Workers, Home Care Liaison Nurses and Pharmacist. In May, 1987 an AIDS dedicated Clinic was opened. Administrative support in policy and program planning is provided through the AIDS Advisory Committee. Research has been fostered by this cohesive environment.
Results. In a weekly 1 hour meeting the AIDS Care Group reviews all inpatients and problematic outpatients. Inpatient census averages 17 patients/day (12/88). Average length of stay is 11.5 days at a per diem estimated at $800. The AIDS Clinic has grown to 866 visits/month (12/88).
Conclusion. Comprehensive AIDS care integrated across medical wards and outpatient services has supported the diffusion of clinical skills amongst nursing staff, housestaff and students of various disciplines. Rapid expansion of the AIDS Clinic has helped contain the utilization of inpatient services.

T.H.P.15 COMMUNITY-BASED PNEUMO-CLINICS AS A MODEL FOR COST-EFFECTIVE LOWERED MORBIDITY AND MORTALITY IN HIV DISEASE.

Harrington, Mark; Kirschenbaum, D.Z. AIDS Coalition to Unleash Power, New York NY, USA.

Objective: To propose the development of community-based outpatient clinics in areas whose dense concentrations of HIV-infected persons could obtain voluntary, anonymous HIV testing in conjunction with quarterly T-cell monitoring and PCP prophylaxis for those at risk. Discussion: PCP pneumonia is the presenting condition at diagnosis for 60% of PWA's, and the cause of death for at least as many. Aggressive monitoring and early intervention would prevent many of those at risk from progressing to life-threatening stages of HIV disease. Clinics must be instituted in areas most affected by the epidemic. Early intervention will prevent massive medical expenses attendant upon hospitalization, drastically lowering HIV-related morbidity and mortality.
Conclusion: In conjunction with the AIDS community, the Federal government should sponsor a pilot program of community-based outpatient pneumo-clinics in New York City.

T.H.P.17 LIFETIME PATTERNS OF MEDICAID EXPENDITURES FOR PERSONS WITH AIDS IN CALIFORNIA

Andrews, Roxanne*; Keyes, Margaret*; Pine, Penelope**.
*SysteMetrics/McGraw-Hill, Washington, D.C., USA.
**Health Care Financing Administration, Baltimore, Maryland, USA.

Objective. As the health care insurance program for certain groups of poor persons, Medicaid finances the health care of about 40% of persons with AIDS in the U.S. This study examines Medicaid expenditure patterns for cohorts of Medicaid enrollees with AIDS in California in 1984 to 1986.
Methods. The source of data is the HCFA Medicaid Tape-to-Tape person-level data file including enrollment, utilization and expenditure information. Persons with AIDS in the California files were identified using ICD-9-CM codes associated with AIDS.
Results. For the cohort beginning their enrollment in 1984, lifetime Medicaid expenditures totaled almost $22,000. Those with enrollment lengths of 3 months or less (about 20% of the study group) have monthly expenditures that are 2 to 3 times the monthly rate of those enrolled for longer periods. There is a peak in monthly expenditures during the first two months and last two months of enrollment in Medicaid.
Conclusion. Because of their high monthly costs, knowledge about persons enrolled in Medicaid for a short time is important so that services can be appropriately targeted within Medicaid. The peak in expenditures in the first months of enrollment indicate that a major medical event precipitates enrollment in Medicaid. The peak in expenditures in the last months are consistent with patterns observed in studies on last year of life.

T.H.P.14 ESSAI D'ADAPTATION D'UN CABINET DE MEDECINE GENERALE EN VILLE

Jean Florian METTETAL, M. BARY, F. EDELMANN, A. JOURDAN.
ARCAT-SIDA,(Paris, France)

Objectifs: Adaptation en ville du système de santé français.
Méthodes: Evaluation permanente des difficultés rencontrées par les patients et d'une réponse possible de médecins d'un cabinet progressivement spécialisé "HIV" de mars 85 à déc. 88, interviews des différents correspondants et intervenants sociaux, liaison avec les associations, informatisation.
Résultats: Les médecins du cabinet ont été confrontés à d'importantes lacunes:
1 - la double fonction du généraliste, médicale et psychologique, ou d'écoute, sociale et juridique, est limitée par le manque de formation, de temps, de prolongements complémentaires et adaptés.
2 - la structure traditionnelle du cabinet: médecins rémunérés sur des actes médicaux, et secrétariat.
3 - l'environnement: Les prolongements privés du cabinet, médicaux, paramédicaux, sociaux et juridiques sont aléatoires et en partie budgétisés. Le secteur public ne s'occupe que des cas extrêmes.
Pour combler ces lacunes, les médecins du cabinet ont cherché à acquérir:
1 - de nouveaux réflexes et connaissances: En 86, les bilans, le suivi des patients et des thérapeutiques étaient souvent hospitaliers et les besoins sociaux ne pouvaient être résolus qu'à titre individuel. En 88, la prise en charge médicale a permis de limiter le recours hospitalier, et la multiplication des contacts avec les organismes sociaux publiques et privés a satisfait aux besoins importants, mais n'a pas empêcher que des besoins exprimés ne deviennent des urgences. Il n'a pas été possible de réaliser une prévention sociale.
2 - un nouveau type de gestion, difficile à concrétiser: le cabinet continue de se heurter à la difficulté de s'informer, aux coûts, et aux réticences, voire aux rejets, des organisme censés être compétents.
Conclusion: Une évaluation réelle de la fonction de médecin généraliste et de la place d'un cabinet de ville, la nécessité d'inclure dans les dépenses de santé des actes sociaux préventifs, sont des préalables à une meilleure prise en charge des patients, à la diminution du coût de la maladie pour la société, et à l'acceptation sociale du problème.

Financement et assurances
Financing and Insurance

T.H.P.16 THE "MEDICAIDIZATION" OF AIDS

Jesse Green* and P. Arno **
*NYU Med Ctr, NY, NY, USA,**Montefiore Med Ctr, Brx, NY, USA

Objective. To describe a shift in the burden of payment for AIDS patient care from private to public sources.
Methods. Analysis of data on all AIDS related hospital discharges from New York State and California over a four year period.
Results. There was a sharp trend toward an increasing proportion of the burden of AIDS care being financed by public sources, primarily Medicaid, and a decreasing proportion by Blue Cross and private insurers (See Table). These trends are only partially explained by demographic shifts. We see the same trends among all racial/ethnic groups. The most likely explanation is that loss of employment, loss of private insurance, and subsequent impoverishment of PWA's leads to Medicaid eligibility. It is well known that most private physicians avoid treating Medicaid patients because of very low reimbursement rates. Therefore the "Medicaidization" of AIDS threatens the goal of shifting care to primary settings.

SHIFT IN SOURCES OF PAYMENT FOR AIDS CARE IN THREE CITIES, 1983 TO 1986

	New York		Los Angeles		San Francisco	
	1983	1986	1983	1986	1983	1986
Blue Cross	35%	26%	17%	10%	21%	10%
Commercial/HMO	8%	7%	58%	50%	46%	44%
Medicaid	36%	49%	11%	23%	19%	30%

The trend was evident even after controlling for shifts in the racial makeup of the population hospitalized for AIDS. Among whites with AIDS in NY, Blue Cross' share of hospital care declined from 52% to 42% while Medicaid soared from 16% to 29%. Among blacks with AIDS in NY, Blue Cross, which only covered 16% of hospitalizations in 1983, covered even fewer (14%) by 1986, while Medicaid's share of AIDS hospitalizations among blacks increased from 49% to 64%.
Conclusion. A substantial shift in the burden of financing AIDS care from private to public sources occurred from 1983 to 1986 in the three cities with the most AIDS cases. This trend raises important public policy questions regarding access to care, equity, and the impact of the epidemic on city, state, and federal budgets.

T.H.P.18 CONSUMPTION OF MENTAL HEALTH AND SOCIAL SERVICES BY PWAS

Cvitanic M., Pascal A., Bennett, C.L., Bennett, R.L. RAND/UCLA Center for Health Policy Studies, U.S.A.

Objective: To describe use of mental health and nonmedical resources by PWAs. Resource use in physical units by Calif. PWAs should be relevant to health planners in other countries.
Methods: 40 gay men in Los Angeles with various stages of HIV infection were (1) interviewed regarding two year retrospective use of medical and non-medical resources, medical history, insurance and employment status and (2) asked to provide prospective medical bills for a 12-month period.
Results: A subgroup of 18 men with KS; mean age, 40.6 yrs. (range 31-65 yrs); average use of hours of mental health care, .51 hrs. per week (range 0-2 hrs/wk) value of $21.83/wk; 80% of services provided by volunteer orgs; Mean use of volunteer org. food bank services, 14.88 wks/yr (+/-24.90 wks/yr), value of $260.40/yr; Mean practical assistance from friends and family, 1.91 hrs/wk (range 0-14 hrs/wk) value of $21.01/wk. Mean financial assistance from friends and family, $26.39/week (range 0-$230). The total yearly friends and volunteer organizations.
Conclusion: At conference we will present mental health and nonmedical resource use for full sample as function of (1) insurance coverage (pvt. Blue Cross, public) income and diagnosis (KS, PCP, other) will present cost breakdown across payors (pvt. ins., HMO, Blue Cross, Medical, etc.,)

T.H.P.19

MEETING THE NEEDS?

Cooper Jonathan Director of Programmes, United Kingdom, Haemophilia Society.UNITED KINGDOM

Objectives: To assess the needs of people living with HIV and examine financial provision made by the State for individuals and their carers.
Method: The weekly living costs of people with symptomatic HIV infection were assessed. An investigation of need compared to existing state benefits was made. Benefits examined were income related, contributory and non-contributory based.
Results: Personal needs per week for single person living with AIDS under 25 years old, on top of regular living costs = 65.22 Pounds.

Income Related Benefits Available:		
Income Support - Disability Premium:		13.05 Pounds
Non-Income Related Benefits Available:		
Mobility Allowance:		23.05 Pounds
Attendance Allowance:	(lower rate)	22.00 Pounds
Invalid Care Allowance:		24.75 Pounds
Invalidity Benefits:		41.15 Pounds
Severe Disablement Allowance		24.73 Pounds

Conclusion: The only benefits in the U.K. applicable to meeting the needs of people with symptomatic HIV infection is the 13.05 Pounds Disability Premium. This premium is only available to those with no, or virtually no income. As well as being inadequate the premium also has a qualification period

T.H.P.20

ACCESS TO INSURANCE AND PERCEIVED DISCRIMINATION BY HOMOSEXUAL MEN.

Kass, Nancy. Johns Hopkins University, Baltimore, Maryland, U.S.A.

Objective: 1) To compare access to health, life and disability insurance among homosexual men who are seronegative, seropositive or have AIDS; 2) to compare perceived discrimination in employment and in medical/dental treatment.
Methods: Self-administered questionnaires were distributed to Baltimore and Los Angeles MACS participants between October 1987 and December 1988. Questionnaires also were distributed to supplemental samples of AIDS and leukemia patients (the latter as a comparison group) at the Johns Hopkins Hospital.
Results: Analysis of the first 298 of 1600 subjects revealed the following results:

	Baltimore	L.A.	Leukemia	HIV-	HIV+	AIDS
Has any health insurance or Medicaid	95%	85%	100%	96%	93%	79%
Was asked about previous HIV testing or required to be tested by insurance company	4%	6%	–	3%	5%	19%
Turned down for health insurance	3%	5%	0%	3%	2%	11%
Fired for being gay	9%	13%	–	9%	10%	11%
Refused treatment by a doctor or dentist	4%	5%	–	0%	10%	32%

Conclusion: Persons with AIDS are more likely than seropositive or seronegative persons to be uninsured, to have been turned down for health insurance and to have been refused medical or dental treatment. Seropositives perceive more discrimination by doctors and dentists than do seronegatives.

T.H.P.21

COSTS OF HOSPITALIZATION FOR AIDS PATIENTS AT A COMMUNITY HOSPITAL IN CONNECTICUT

Lyons, Robert W.; Madden, G and Costanzo, R., St. Francis Hospital and Medical Center, Hartford, Connecticut, USA.

Object. To determine the cost of in-patient care for patients with AIDS (PWA) at community teaching hospital in the northeastern United States in fiscal year (FY) 1988.
Methods. All PWA aomitted are known to the Infectious Disease department. Detailed billing records of all PWA admitted from 10/1/87 to 9/30/88 were obtained from accounting department.
Results. 51 PWA had 108 admissions. The average length of stay (ALOS) per admission was 13.7 days. (The ALOS for all 23,122 admissions in FY 1988 was 7.5 days.)

The cost for PWA was $879,462 - $8,143/admission or $17,244/PWA/year. The largest cost was for room, $473,193, and includes $121,489 for 16 admissions totaling 210 days in an ICU. Laboratory costs were $126,782.

The total reimbursement received was $434,140 for a loss of $445,321 - a loss of $4123/admission or $8732/PWA/year. Reimbursement sources are shown:

Source	No.	Payment	Pay/Adm.	Loss
State Welfare	64	134,254.08	2097.72	361,273.28
City Welfare	17	62,086.66	3652.16	61,414.33
Insurance	20	161,998.55	8099.93	24,243.96
Self Pay	3	21,294.63	7098.21	(8,957.71 gain)
HMO	4	54,507.00	13,626.75	7,346.58

Conclusion. As the number of indigent PWA increases the financial burden on community hospitals will become unbearable unless more money is allocated for patient care and more out-patient facilities are developed.

T.H.P.22

HOW DO PERSONS WITH SYMPTOMATIC HIV DISEASE FINANCE THEIR CARE IN TEXAS

Crane Martin*, Tortolero S*, Hines A**, Jardine L*, Johnson C**
*University of Texas Health Science Center at Houston, Texas, U.S.A.
**Southwest Texas University, San Marcos, Texas, U.S.A.

Objective. To determine utilization of medical and social services and payment by persons with HIV infection in the State of Texas.
Methods. An anonymous self-administered survey of HIV-infected persons in selected urban areas of Texas was undertaken in mid-1988 at the request of the State Legislative Task Force on AIDS. Participants identified through physicians, AIDS service organizations and other care providers were given surveys that were mailed back either to the investigators or the Task Force office. Forty percent (40%) of those distributed were returned.
Results. Respondents included 71 asymptomatic (AS), 81 symptomatic (SX) and 280 AIDS patients. ALL AIDS patients had seen a physician at least once in the three months prior to the survey (avg= 7.0 visits) and 44% had been hospitalized. There was heavy utilization of dentists and various counseling services. Between the time of first HIV-related diagnosis and the survey, the proportion of employed AIDS patients decreased (from 83% to 23%), as did the proportion with private insurance (from 60 to 41%); the proportion relying on public and indigent care exclusively increased (from 8 to 21% and from 5 to 21% respectively). Of AIDS respondents, 53% had spent all their savings on their illness and 44% were unable to pay for prescription drugs. A similar pattern was present for SX respondents.
Conclusion. As illness progresses, an increasing proportion of once prosperous persons are forced on the indigent care system in Texas.

T.H.P.23

HEALTH INSURANCE STATUS AND THE UTILIZATION OF HEALTH SERVICES IN A COHORT OF IV DRUG USERS

Solomon Liza, Frank R, Celentano D, Vlahov D, Cohn S. The ALIVE Study. The Johns Hopkins School of Hygiene and Public Health, Baltimore MD, USA

Objective To identify the patterns of health service utilization and the financing of outpatient health care services in a population of HIV positive and negative IV drug users (IVDUs).
Methods A cohort of IVDUs, recruited into a natural history study of HIV infection were interviewed to determine the type of health services used, and the means of financing these services. Persons with AIDS were excluded from recruitment. Correlations between HIV serostatus and type of insurance were examined.
Results Among the first group of 305 respondents, 64 (21%) were HIV positive (ELISA and WB confirmation). Forty-three percent of the study population had at least 1 outpatient visit within the past six months. Sixty-three percent of these visits were hospital based. Nine percent had a hospital admission. Presently 38% of the population is covered by Medicaid. Medicaid coverage did not vary by serostatus.
Conclusion The numbers of HIV positive IVDUs who do not have insurance suggests additional planning for an increasing Medicaid population is indicated. Further, this population's preference for using hospital based facilities, frequently emergency rooms, will continue to burden these facilities and be costly to the system.

T.H.P.24

THE SHARE OF AIDS MEDICAL CARE COSTS PAID BY PRIVATE INSURANCE IN THE UNITED STATES

Eby, Charles. Health Insurance Association of America.U.S.A.

Objective. To assess the merit of alternative sources of data on the distribution of AIDS medical costs among various payers in the United States.
Methods. The most widely cited estimates of payer shares are those developed by Andrulis, et al, based on surveys of public and teaching hospitals, and estimates of the Medicaid share developed by the Health Care Financing Administration. However, data from the National Hospital Discharge Survey, and data from local hospital associations appear to conflict with these widely cited estimates. This presentation reviews the strengths and weaknesses of all of these data, in an effort to identify the best estimate of payer share and the degree of uncertainty attached to it.

T.H.P.25 THE GLOBAL PHILANTHROPIC RESPONSE TO AIDS

Moskie, Steve*; Seltzer, Michael**
*Program Officer, Aetna Life and Casualty Foundation, Hartford, Connecticut, U.S.A.; **Executive Director, Funders Concerned About AIDS, New York, NY, U.S.A. Other additional panelists to be forthcoming (from Canada, Western Europe, and Latin America)

Objective. To provide information on the global philanthropic response to the HIV epidemic.
Methods. Panelists will present data on the contributions that foundations and corporations have made in providing resources to AIDS/HIV initiatives.
Results. All participants will understand how foundations and corporations can provide financial and in-kind support for certain types of AIDS projects.
Conclusion. Philanthropic resources are available now in some countries for specified initiatives, and more funding should become available in the future.

T.H.P.26 HEALTH INSURANCE INDUSTRY PERSPECTIVES ON THE 1988 REPORTS OF THE PRESIDENTIAL COMMISSION ON THE HIV EPIDEMIC AND THE INSTITUTE OF MEDICINE'S CONFRONTING AIDS: UPDATE 1988

Eby, Charles; Payne, Jude. Health Insurance Association of America, U.S.A.

Objective. To comment on these two important reports from the perspective of the health insurance industry, which is the single largest payer of AIDS costs in the United States.
Method. We compare the recommendations in the two reports with established policies of the Health Insurance Association of America, which represents the health insurance industry. We note areas of agreement and conflict. In the area of health care financing, we review the technical assumptions underlying the reports, suggest alternative assumptions in some areas, and assess the implications of these alternatives for policy.

T.H.P.27 AIDS CASE MANAGEMENT: WHAT INSURANCE COMPANIES ARE DOING

Eby, Charles; Jajich-Toth, C. Health Insurance Association of America.

Objective. To review the use of case management for AIDS patients by health insurance companies in the United States.
Methods. We present information on AIDS case management developed at a 1988 meeting of health insurance companies conducted by the authors. That information is updated with the results of more detailed studies conducted by health insurance companies since the meeting and by recent survey research conducted by the Health Insurance Association of America.
Results. Most health insurance companies in the United States have case management programs that apply to AIDS patients. Techniques for administering such programs vary widely, as do the reported effects on health care costs. Early identification of AIDS cases from claims data is a key problem. Nevertheless, these programs can reduce costs while providing more appropriate care.

T.H.P.28 STATISTICAL METHODOLOGY FOR STUDY OF THE AIDS EPIDEMIC

Thomsen, Donald L., Jr.; Societal Institute of the Mathematical Sciences (SIMS), New Canaan CT, U.S.A.

It is imperative to accelerate research for the AIDS epidemic. One way is to organize groups of outstanding researchers in relevant research fields and in addition encourage collaboration among these groups. Various modern communications systems are now of great assistance when research groups are located far apart geograhically. The Societal Institute of the Mathematical Sciences (SIMS) has organized a Study on statistical methodology for the AIDS epidemic where drug abuse is playing an increasingly significant role. To carry out this Study research centers consisting of outstanding research statisticians are being coordinated by SIMS at three universities: University of California (San Francisco), New York University, and the University of Waterloo (Canada). A fourth center may soon be added in Europe; this SIMS approach should not be constrained by international boundaries. The development of effective statistical methodology is critical in view of the fact that AIDS data is sparse and has only been available for a short period of time. Specific examples of research results obtained under this SIMS approach will be presented to demonstrate the acceleration thesis asserted above. Other areas of AIDS research might be able to benefit from this SIMS experience.

Support for this SIMS Study has been provided by the National Institute on Drug Abuse (NIDA)(USA).

T.H.P.29 AIDS IN THE WORKPLACE: A WORLDWIDE HEALTH CONCERN BECOMES A BUSINESS CONCERN

Ross, Paul A., Ed.D., Manager, AIDS Program Office, Digital Equipment Corporation, Concord, MA 01742 USA 508-264-1418

OBJECTIVE: To describe the multi-faceted strategy that Digital Equipment Corporation, a Fortune 50 international company with 123,000 employees worldwide is implementing to manage AIDS in the workplace. Key to the strategy is the AIDS Program Office, a part of Corporate Employee Relations. This office, the first and only one of its kind, is the focal point for education, policy, resource and referral, community and public relations and corporate philanthropy in regard to AIDS. Participants will learn about:

1. Digital's Commitment/rationale
2. Elements of their award-winning educational program (U.S. Department of Health and Human Services)
3. Communications and Implementation Strategies
4. Community leadership/Corporate philanthropy
5. Key factors for success

Participants will have a clear understanding of one company's response to this serious issue and will have strategies/guidelines for adapting the model to their own work environments. The purpose of this session is to empower and challenge others to move forward.

W.H.P.1 COSTS OF TREATING AIDS PATIENTS IN AFRICA

Makinen, Marty; Wong, H. Abt Associates Inc.,
Washington, DC, United States.

Objective. To assess the direct costs of treating AIDS patients in Africa and to determine patterns of treatment of the disease.
Methods. A methodology has been developed to estimate the direct costs of treating AIDS patients at selected health care facilities in African countries and to obtain information about the indirect costs of the disease to the patient population. Such retrospective studies have the advantage of being fast and inexpensive compared to prospective studies, and will provide important baseline data as a foundation upon which future studies can be built. Data will be collected on initial and subsequent diagnosis, number of visits and admissions to health facilities, length of stay for admissions, and costs of providing health services in the facilities. This information will be obtained from patient records, salary histories, and investigation at health care delivery sites. A questionnaire will be administered to the sample population to estimate the costs to the patients of treating the disease outside of the health care facilities, including charge per visit, charge per hospital stay, and charges for drugs.
Results. Information from such studies will document the magnitude and incidence of the costs required to treat the disease.
Conclusion. Such a methodology will help decision makers to weigh the costs of treating AIDS patients against the costs of treating other patients; to develop cost effective treatment protocols; and to prepare for the anticipated growth of the epidemic.

W.H.P.2 HEALTH-CARE COST OF AIDS AT A HOSPITAL IN CANARY ISLANDS

ARMAS,MARIO;Jiménes,P.;Martín,J.M.;Gómes,E.;Antolín,J.;
Acosta,A. et al.
Hospital Nuestra Señora del Pino.Las Palmas.Spain.

OBJECTIVE:To evaluate health-care burden of AIDS and AIDS-related conditions on our Hospital.
METHODS:Review of clinical records of HIV-infected patients admitted to Hospital or attended at the outdoor clinic from Jan.1987 until Nov,1988.
RESULTS:Number of HIV-infected:144.Number of AIDS cases:2o.
Duplication time of AIDS cases:8 months. AIDS cases dead:7(35%)
Main risk-factors for AIDS:Male homo-bisexuality(55%),and parenteral drug abuse(25%). Main opportunistic infections:TBC(35%),PCP(35%),and candidal esofagitis (30%).
Number of AIDS-related admissions:42.Mean delay from admision to definite diagnosis of suspected infection:13 days.Mean length of hospitalisation:31 days. Number of invasive procedures per admission: 1.4 (surgery,biopsy,or endoscopy).Cost per admission:83o.ooo pesetas (72oo USD).
CONCLUSION:AIDS cases are rapidly increasing in our Hospital area.
Our AIDS cases are mainly homo-bisexual males and parenteral drug abusers.
Tuberculosis is a leading opportunistic infection in our AIDS patients.
It is necessary a plan for reducing pre-diagnostic time,length of hospitalisation and health-care cost.

W.H.P.3 DIRECT MEDICAL COSTS OF AIDS IN LATIN AMERICA AND THE CARIBBEAN: MORE COST-EFFECTIVE MODELS

Jorge Garib*, Y. Kouri**, F. Zacarias***, D. Shepard****,
J. Sotomayor*; *San Juan AIDS Institute, San Juan, Puerto Rico; **Harvard Institute for International Development, Cambridge, MA; ***Pan American Health Organization, Washington, DC; ****Harvard School of Public Health, Boston, MA, U.S.A.

Objective. To describe, compare and analyze the estimates of the direct medical costs of AIDS patients available to present in Puerto Rico, Dominican Republic, Mexico, Costa Rica, Brazil and Argentina, and to analyze the policy issues related to the respective health care delivery systems.
Methods. A compilation and comparison of all costs related to out-patient and in-patient care for AIDS patients available from official sources of the six countries, was followed by an analysis of how these costs related to the respective systems for financing and delivery of medical care.
Results. The availability of different types of services varied among countries. Length of hospital stay, costs per patient per year and share of hospital cost in the total cost of services, when comparable, were significantly higher in those places where treatment was mainly hospital-based and a comprehensive approach was not available.
Conclusion. A comprehensive system of health care including ambulatory, extended, home and hospice care provides a more cost-effective approach to the management of AIDS patients and may be applied in other LDC nations. Cooperation among nations to share their experiences in developing cost-effective models to contain the costs of AIDS and to maximize the utilization of available resources should be promoted.

W.H.P.4 COMPARATIVE COSTS OF AIDS CARE IN PUBLIC AND PRIVATE SETTINGS

Kouri, Y.*; Shepard, D.; Risek, R.*; Risek, J.E.**; Smith, S*;
Verjee, S.*
*Harvard Institute for International Development, Cambridge, MA, USA,
**University of Puerto Rico Medical School, San Juan, PR.

Objective. To identify the cost advantages of public and private settings to make AIDS care more cost-effective.
Methods. We assessed retrospectively the cost of AIDS care in 54 consecutive episodes of hospitalization in a private hospital and 249 in a public hospital in San Juan (SJ), PR in 1987-88. This area has many characteristics of a middle-income developing area. Types, amounts, and unit costs of services were abstracted from medical records and cost reports using identical protocols.
Results. The average length of stay was 16.4 days in the private hospital and 17.5 days in the public hospital. The cost per day averaged $200 in the private hospital and $340 in the public hospital. Patterns of care appeared similar. In 1988, however, after private management and incentives had been introduced in the public hospital, the average cost per day was reduced to $290.
Conclusions. The private hospital appeared to provide care more effeciently through a lower daily rate, earlier discharge, and more efficient use of acillary services. Good management can improve the efficiency of care of patients with AIDS.

W.H.P.5 Economic Analysis of AIDS in Puerto Rico

José I. Alameda-Lozada*, Alfredo González-Martinez**
*Assistant Professor of University of Puerto Rico at Mayaguez,
**Professor of University of Puerto Rico at Mayaguez.

The authors attempted to assess AIDS epidemic from the economic point of view. Specifically, they estimated the economic costs of AIDS for the Puerto Rican economy. It should be pointed out that Puerto Rico depicts high levels of AIDS prevalence rate as compared with other places. The Island ranks number seven among the fifty states and between the Latin American countries only Brazil surpassed the number of cases per million inhabitant in Puerto Rico.
The estimated economic costs consist in two main categories: Direct costs and indirect (implicit costs). The direct costs include medical care and, research & education expenditures. Indirect costs include the income losses due to illness and disability (morbidity) as well as present values of future earnings lost by premature death (mortality).
A striking result from the study is that main exonomic impact of AIDS between 1981 to 1988 is due to indirect costs rather than direct costs. The former accounted for over 80 percent of total estimated economic costs. The reason for this high indirect costs is attributed to the fact that most of the victims of AIDS are young persons. In 1988, 72 percent of AIDS victims are in 20 to 39 year age bracket, and therby, in their most potencially productive years. The average age for and AIDS victim is 34 years. Finally, the authors forecasted economic costs for the fiscal years 1989 to 1992 using a discount rate of 5 percent.

W.H.P.6 THE ECONOMIC AND SOCIAL IMPLICATIONS OF AIDS IN AN AFRICAN SETTING

*Davachi, Farzin, *Mayemba, N., *Kabongo, L., *Ndoko, K. and
**N'Galy, B.
*Department of Pediatrics, Mama Yemo Hospital and **Ministry of Health,
Kinshasa, Zaire

Objective: To evaluate the economic and social impact on families of children with AIDS.
Methods: We reviewed the economic status of 84 families of children with symptomatic AIDS admitted to a state subsidized teaching hospital and the social interaction of the community toward the afflicted family.
Results: 39 parents were low echelon employees, 42 were unemployed and 3 had already died. The average hospitalization was 24 days with 23% mortality. A single hospitalization was 4 times and funeral expenses 11 times the average monthly income. Those who were employed received assistance from their employers for medical expenses and burial, however, wake expenses were supported by the family. African tradition requires a dignified and respectful funeral which entails considerable expense. The unemployed depended on family and friends for financial assistance. The most remarkable observation was the community's response to the afflicted and their families, A twofold process was observed: the community was tolerant and accepting of AIDS patients; extended families, friends and neighbors gave an abundance of moral support and contributed toward the medical care costs and funeral expenses.
Conclusion: The AIDS epidemic has placed a financial burden on the society. In the face of economic crisis, Africans continue to show a strong social solidarity, acceptance and goodwill towards AIDS patients and their families. In the case of demise, the community contributes toward the funeral expenses.

Méthodologie des coûts
Costing Methodology

W.H.P.7

HIV CASE MANAGEMENT UTILIZING INFORMATION SYSTEMS

Moreno, Sylvia, RN, BSN*, J. Jockush**, T. Emanuele, RN*, K. Karpf, MT(ASCP)***, *Parkland Memorial Hospital, Dallas, Tx., **Univ. of Tx. Health Science Center, Dallas, Tx., ***Dallas County Health Department, Dallas, Tx., USA

OBJECTIVE: To provide a Human Immunodeficiency Virus(HIV) case management system utilizing personal computers(PC) in the healthcare setting.
METHOD: Parkland Memorial Hospital(PMH) is the largest medical provider for HIV infected patients in Dallas County, Tx., with an active caseload of 588 patients out of 1523 total. There are three major components to the data collection system: clinical, accounting and AIDS Registry. The AIDS clinic utilizes 5 AT-class PC's in a local area network to maintain clinical and research data. The Medical Records Department maintains data on a single AT-class PC on all HIV related hospitalizations. The Hospital Information System Department utilizes its mainframe computer to report HIV related data at the incident of service level(demographics, charges and collections).
RESULTS: The clinic database measures and monitors patient data to enhance treatment, quality assurance and research. It also serves as a mini-medical record providing immediate access to data for telephone consults and interfaces with community healthcare providers. Networking between healthcare facilities/organizations to track total service utilization by one patient.
CONCLUSION: Achievement of quality case management through an enhanced information component. Total cost reduction through data analysis/trending of costs, clinical treatments and collection of epidemiological information. This system is utilized by Administration, Nursing Management, Clinicians, Quality Assurance, Infection Control, Business services and Public Relations.

W.H.P.8

DIRECT COSTS AND FINANCING OF HIV HOSPITAL AND COMMUNITY-BASED TREATMENT

Hidalgo, Julia.*
*MD Department of Health and Mental Hygiene, Baltimore, MD., U.S.A.

Objective. The economic impact of HIV on the U.S.A. health care system has been difficult to measure. This paper applies a model automated HIV information system to measure use and direct costs of HIV-related treatment across providers and payer. Methods. Institution and community-based services used by 1,300 Maryland residents with HIV disease during the period between 1981–1988 were retrospectively studied. An automated information system made up of longitudinal, person-based files serves as the basis of this study. The system links HIV registry, vital statistics, hospital, long term and chronic care, and community-based service, and public and private health insurance claims records to measure the nature, volume, and costs of service use associated with HIV treatment during the period between diagnosis and death. Results. HIV-related costs are estimated for treatment of ARC and AIDS. Inflation-adjusted average lifetime, annual, and per diem costs, as well as components of cost, are reported. Payer-mix and the difference between costs, charges, and payments are described, as well as shifts in payment source during the course of illness. Factors including socio-demographic characteristics, transmission group, survival time, and case and service-mix are also discussed. Conclusion. Findings of this study are useful to policy makers at the local, State, and Federal levels in planning services and financing required to meet the needs of persons with HIV disease.

W.H.P.9

SOCIO-ECONOMIC MODELS TO ASSESS THE ECONOMIC IMPACT OF HIV INFECTION

Kahn, Joan
McGill Centre for Medicine, Ethics and Law; Montreal, Quebec, Canada.

Objective- To propose two comprehensive models that could be applied in the assessment on an international scale of the economic impact of HIV infection.
Method - A review and comparative analysis was carried out of existing literature on the economic impact of HIV infection, drawn from four countries (Canada, U.S., Australia and U.K.).
Results - The literature varied considerably with respect to its acknowledgement of the ways in which costs might be affected by:
1)Geographic Differences: local, regional and international, e.g. with respect to incidence and prevalence, modes of transmission and manifestation of pathology.
2)The Effects of Change, e.g., in disease definition, in treatment and diagnosis, in health care delivery systems, funding and utilization, and in the availability of human and natural resources.
3)Other factors, e.g. absence of an explicit conceptual framework, models and methodologies. This lack of explicitness limited meaningful commensurability.
Conclusion: Two comprehensive models are defined:
Model X: Three Orders of Costs - This model delineates three "orders" of costs : First Order (mandate)Costs: "Care" and "Containment"; Second Order Costs: foregone earnings, household services, labour and expertise, research, consumption and progeny; Third Order Costs, i.e. "psycho-socio-cultural".
Model Y: The Cascade Effect - This model delineates seven "levels" of cost: individual, immediate support system, community, institutional, government, society, and international. The possible advantages or disadvantages relating to the development and use of a standardized, international approach in determining the economic impact of HIV infection will be discussed.

W.H.P.10

HIV INFECTED HOSPITAL PATIENTS IN NEW YORK STATE (NYS); THE CREATION OF LONGITUDINAL INFORMATION FROM A HOSPITAL DISCHARGE DATA SYSTEM

Kaufman, GI, Grabau, JC, Novick, Lloyd F, Han, Y, Schmidt, E. New York State Department of Health, Albany, NY, USA

Objective. To obtain longitudinal information regarding HIV infected patients in NYS acute care hospitals, useful for describing HIV related acute care needs.
Methods. Abstracted medical records of patients discharged from NYS acute care hospitals between January 1,1983 and October 1, 1987, which contained a diagnosis of HIV infection (36,664) were linked into a longitudinal file (HIVLF) of patient specific cases (20,005). The records do not contain explicit personal identifiers, so linkage was accomplished using hospital code, medical record number, sex, date of birth, address, and payee identification codes.
Results. A validation study utilizing 1985 Medicaid discharge information indicated: the HIVLF cases contained 85% (SE:±2%) of the expected discharges; the number of HIVLF cases was too large by 10% (SE:±2%) due to a failure to link all the discharges to the appropriate cases.
The number of new HIV patients (HIV infection identified for the first time), entering the acute care system increased monotonically on a quarterly basis from 1984 through 1986. In the first quarter of 1984, 401 new HIV patients utilized the acute care system, as compared to 1899 in the last quarter of 1986. During the first year of acute care, new HIV patients in 1984 or 1985 exhibited an average of 1.8 admissions, and a mean total of 30 inpatient days. During this first year, patients with multiple stays had longer first and last stays as compared to intervening stays. As the number of stays increased the period between stays decreased and the length of stays of each admission decreased.
Conclusion. The HIVLF is of sufficient quality to be useful for estimating acute care resources required to respond to the HIV epidemic.

W.H.P.11

TEMPORAL CHANGES IN FINANCING OF HIV TREATMENT

Hidalgo, Julia.* MD Department of Health and Mental Hygiene, Baltimore, MD U.S.A.

Objective. The financial burden of HIV treatment is shared among Federal, State, and private payers. It has been difficult to assess, however, the distribution of this burden among payers during the course of the AIDS epidemic. This paper applies a model HIV information system to measure temporal changes in financing of hospital, long term and chronic care, and community-based HIV-related treatment across payers. Methods. Institution and community-based services used by 1,300 Maryland residents with AIDS diagnosed between 1981–1988 were retrospectively studied. An information system made up of longitudinal, person-based files serves as the basis of this study. The system links HIV registry, vital statistics, hospital and community-based service, and insurance claims records to measure the nature, volume, and costs of AIDS treatment during the period between diagnosis and death. Results. Volume of AIDS treatment, associated costs, and payer mix are examined during the course of illness. Inflation-adjusted costs, charges, bills, and payments made by Federal and State payers are measured. Unreimbursed services generated by the difference between charges, bills, and payments are estimated. The proportionate distribution of the financial burden of HIV-related treatment and level of reimbursement expended by public and private payers is reported for the 8 year period studied. Probability of shifting from private to public insurers is estimated, are shifts from State to Federal assistance categories during the course of illness. Factors associated with shifts in payer, including socio-demographic characteristics and risk group, are also discussed. Conclusion. Findings of this study are useful to policy makers and health insurers in projecting the fiscal impact of the AIDS epidemic.

W.H.P.12

A PRODUCTION FUNCTION APPROACH TO ESTIMATING THE AGGREGATE MACROECONOMIC IMPACT OF AIDS ON CENTRAL AFRICAN ECONOMIES

Over, Mead*.; Bulatao, R.*; Jamison, D.**; Lau, L.***
*The World Bank, Washington, D.C.;**University of California, Los Angeles;***Stanford University, California.

Objective: To combine demographic projections of the HIV epidemic's impact on population size and structure with economic projections of its impact on gross domestic product (GDP) in order to estimate the epidemic's impact on per capita GDP.

Methods. Based on previous modelling of the population dynamics of the disease by one of the author's and on aggregate production functions for sub-Saharan Africa which incorporate measures of human capital, the paper estimates the future course of both the GDP and the population under a variety of alternative assumptions. Sensitivity analysis is performed with respect to the size of the epidemic and with respect to the amount of human capital embodied in the affected individuals.

Results. Results are presented for the epidemic's impact on GDP growth rates and GDP per capita and compared with those of a naive model using a constant average cost per HIV-infected person. The discounted present value of losses due to the infection of a single individual with HIV are computed under several discount rates.

Conclusion. The AIDS epidemic is affecting most severely certain sub-Saharan African countries that are already experiencing slow or negative rates of per capita GDP growth. This paper estimates the degree to which the AIDS epidemic can exacerbate the growth problems of the most severely affected economies.

W.H.P.13

A MEDIUM-RUN MODEL FOR THE ANALYSIS OF THE ECONOMIC IMPACT OF AIDS IN SUB-SAHARAN AFRICA

Kambou, Gerard*.; Devarajan, S.**; Over, M.***
*Northeastern University, Boston, Massachusetts; **Harvard University, Cambridge, Massachusetts,
***The World Bank, Washington, D.C.

Objective: This study presents an internally consistent view of the medium-term macroeconomic repercussions of the epidemic on the labor market, on the producing sectors and thence on the entire economy of a "typical" sub-Saharan African country.
Methods. The study characterizes the AIDS epidemic as a shock to the supply of labor of several skill categories to several different productive sectors of a "typical" sub-Saharan African economy. The study uses a computable general equilibrium model in order to represent the productivity of the affected skill categories in the various sectors and the flexibility of this typical economy in adjusting to such shocks, and in order to require that projections be internally consistent.
Results. The results estimate the effect on medium-term aggregate macroeconomic performance of alternative assumptions regarding the distribution of the epidemic across skill categories of labor. The paper identifies the critical size of an AIDS epidemic at which general equilibrium methods like those used in this paper give substantially different estimates of the macroeconomic impact than would the easier-to-apply partial equilibrium methods. Results are presented for the epidemic's impact on such macroeconomic aggregates as current account balances as well as for per capita GDP.
Conclusion. Because the study shows that aggregate macroeconomic impact of the epidemic can be substantial in a severely affected African country, expenditures on demonstrably effective preventive measures are justified. Furthermore, the study shows to what degree some allocations of scarce prevention resources across categories of labor may have a more beneficial effect on macroeconomic performance than others.

Modélisation mathématique et prévisions
Mathematical Modelling and Predictions

W.H.P.14

THE SOCIOCULTURAL AND ECONOMIC IMPACT OF AIDS ON SOCIETY

BOOM, Frans M. van den*; Jager, JC**; Reinking, DP*
*Netherlands Institute of Mental Health, **National Institute of Public Health and Environmental Protection, the Netherlands.

Objective. Investigation and analysis of the present and (possible and plausible) future situation(s) of the three mutually dependent AIDS-epidemics: the infection with HIV, the AIDS epidemic and the epidemic of reactions and answers -social, cultural, economic and political- to the AIDS and HIV epidemics.
Methods. A scenarioproject can be separated into three components:
-definition of the existing situation (basis analysis) by means of description and interpretation of the three AIDS epidemics as they exist at present
-the development of a number of future perspectives, as an alternative of the present situation
-presentation of a series of events that could lead to the future perspective with an indication of connecting pathways
Scenario research makes use of data already collected
Results. A differentiation is made into three aspects: epidemiological aspects: economic aspects, socicultural aspects. A model for the description of the course and the scope of the HIV epidemic is conceived. This model, has the epidemiological aspects as reference point. The epidemiological aspects will serve as basis and background for the determination and assessment of the influence of the AIDS and HIV epidemic on society.

W.H.P.15

DECLINE OF AIDS INCIDENCE IN KENYA

L.N. MUTHAMI* DR. N.N. AGATA, **DR. G.S. GACHIHI, *DR. G.G. MBUGUA
DR. T.N. MULANDI**

*KENYA MEDICAL RESEARCH INSTITUTE NAIROBI, KENYA
**KENYATTA NATIONAL HOSPITAL NAIROBI, KENYA.

Objectives: To reduce and control the spread of HIV infection in Kenya.

Method: By August 1988, 3278 cases of AIDS had been reported cummulatively by all the Health Facilities in Kenya. Data from three provinces that have been reporting consistently over a period of 19 months were compared with national figures - Graphical plots, linear trends and predictive models were fitted to the data.

Results: The rate of change for the national figures over the 19-month period show an increasing trend. But comparing 1987 and 1988 there is a definite drop in the number of the new cases reported. At the Provinces, a significant increase was observed in 1987, but the curves had assymptotic tendencies in 1988.

If the 1987-8 rate of change was sustained over 1988-9 the predictive models show a slight increase in the number of cases in Nairobi (425 in 1988 to 598 ± 32 in 1989); a drop in Nyanza (303 in 1988 to 143 ± 34 in 1989); and a drop also at Coast (808 in 1988 to 655 ± 34 in 1989).

Conclusion: The National figures are likely to stabilise or drop after the provision of testing kits, for HIV in all the district Health facilities (currently 30/41) and the current campaign against AIDS.

W.H.P.16

THE USE OF RANDOM GRAPHS IN MODELLING THE TRANSMISSION DYNAMICS OF HIV-INFECTION

Philippe Blanchard, G. F. Bolz, T. Krüger
Fakultät für Physik, Universität Bielefeld, D-4800 Bielefeld 1, FRG

Objective: To develop a mathematical model for the epidemiology of sexually transmitted diseases being able to account for the characteristic features of the HIV-infection. To study mathematically treatable simplified model situations and to use computer simulations based on this approach to deal with assumptions realistic in the case of AIDS.

Methods: Based on two concepts: a random graph, representing the mesh of sexual contacts inside a society, and a discrete time stochastic process, describing the spread of infection on the graph, the model incorporates specific assumptions through specifications on the ensemble of graphs and on the dynamical process. Probabilistic and combinatorial methods allow to rigorously treat simplified model situations, while direct computer simulations deal with realistic assumptions.

Results: Here, the general frame of the modelling approach is described; it is shown how a variety of important details can be incorporated, and how it relates to standard epidemiological models; it is discussed how it may be used in public health planning to predict the effects of certain prevention strategies, a problem which can only be tackled by a model capable of simulating individual behaviour.

Conclusion: This new approach to the epidemiology of sexually transmitted diseases leads to predictions different from standard epidemiological models; it is versatile enough to account for the peculiarities of HIV and to allow for a detailed description of the dynamics of the transmission process; it will be continuously adapted, in its specific assumptions, to reflect the actual state of knowledge about the epidemiology of AIDS.

W.H.P.17

A MODEL FOR EVALUATION OF UNKNOWN NUMBER OF HIV-INFECTED PERSONS

Blaxhult, Anders; Böttiger, M.
National Bacteriological Laboratory, Stockholm, Sweden

Objective. Evaluation of the extent of unknown HIV-infected persons in Sweden and a method used for this purpose.
Methods. Use of information collected by two report systems in Sweden concerning HIV: 1)Reports of HIV-infected persons (coded) initiated in 1985; 2)Reports of cases fulfilling criteria for AIDS since 1983.
Results. Of 228 AIDS cases diagnosed in 1985 to 1988 (22, 51, 68 and 87 cases in respective year), 59, 37, 25 and 32% were diagnosed during the four respective years in conjunction with the first HIV test, i.e. within 3 months of the test. However, there were considerable variations in different groups. In 1988, all hemophiliacs and IV drug users and the majority of the blood tranfusion recipients had been known as seropositive for more than a year before the AIDS diagnosis while those infected heterosexually or homosexually 42 respectively 39% were disclosed as seropositive in conjunction with the AIDS diagnosis. Several of these persons were people coming directly from abroad.
Conclusion. The findings indicate that among hemophiliacs, blood transfusion recipients and IV drug users few of those infected in the early 80ies are not yet detected. However, among those homosexually or heterosexually infected in the early 80ies, a number of individuals have not yet been tested for HIV antibody status. A continuous evaluation of this kind may contribute to the estimation of unknown HIV-infected persons.

W.H.P.18

HIV Carriers: Non-Infectious Initial Interval Slows up Spread of Virus

Gonzalez, Jose J.*; Davidsen, P.**; Moe, C.E.*** and Koch, M.G.****.
*ASA, N-4800 Arendal, **Univ. Bergen, N-5000 Bergen, ***ADH, N-4601 Kristiansand, Norway, ****VÅC, S-546 00 Karlsborg, Sweden.

Where the HIV is sexually transmitted, an increasing number of cases have been observed with a seroconversion latency period lasting 2 to 3 years and longer. Seronegative HIV carriers appear to be initially non-infectious or very slightly infectious. Transmission of the HIV through transfusions of seronegative blood have shown, however, that seronegative HIV carriers become viremic before seroconversion. Recent evidence suggests that the degree of infectiousness increases with the duration and progress of the infection.
Mathematical models show that a non-infectious initial interval causes a surprisingly long delay in the spread of the HIV, and thus a slowing down of the epidemic. During a temporary phase which can last for many years, depending on the length of this interval, the incidence of HIV carriers remains low; it appears as if the disease is spreading in a less infectious form.

Our models take into account heterogeneous sexual behavior, import and export of persons and infections, and variable patterns of infectiousness. Sensitivity analyses show that the non-infectious initial interval has a considerable influence on the dynamics of the spread of the HIV.

W.H.P.19 SHORT TERM PREDICTION OF HIV INFECTION AND AIDS: A CRITIQUE OF THE COX REPORT[1]

Rees, Malcolm
Harrison Department, Radcliffe Infirmary, Oxford, U.K.

Objective. To examine the Cox Report's estimates of the numbers of HIV infections in England and Wales.
Methods. The two main methods used in the Cox Report, the direct method (estimating the sizes of at risk groups and the numbers infected in those groups), and the back-projection method (using AIDS case numbers and incubation functions) are reviewed. A further method, using information from haemophiliac cases, is investigated.
Results. The Cox Report concluded that HIV infections were probably at the lower end of the 20,000 and 60,000 range. The review suggests that 60,000 to 100,000 is more realistic.
Conclusion. The Cox Report is underestimating the serious threat that HIV presents in England and Wales.

W.H.P.21 PROPORTION OF NEW AIDS CASE REPORTS ATTRIBUTABLE TO THE 1987 CDC REVISED SURVEILLANCE CASE DEFINITION: CANADA-UNITED STATES DIFFERENCES

Soskolne, Colin L.
University of Alberta, Edmonton, Alberta, Canada

Objective. To analyze the proportion of new AIDS case reports attributable to the 1987 CDC revised surveillance case definition, and to explore Canada-United States differences to delineate the likely reasons for differential surveillance outcomes.
Methods. The monthly "Surveillance Update: AIDS in Canada" published by the Federal Centre for AIDS, Ottawa, and the "AIDS Weekly Surveillance Report - United States, AIDS Program" published by the Centers for Disease Control, Atlanta, have facilitated the calculation of the proportion of new cases attributable to the 1987 CDC revised surveillance case definition.
Results. Both countries appear to have stabilized in their application of the new case surveillance definition, with Canada and the United States attributing about 15% and 30% of cases respectively to the expanded criteria in the new definition.
Conclusions. HIV antibody testing may be less commonly used in Canada; presumptive diagnoses may be made more commonly in the United States; different diagnostic practices may exist between the two countries; differences in the population prevalence of latent organisms/diseases such as, for example, extrapulmonary tuberculosis, may exist between the two countries. These results affect policy and have implications in the broad areas of projections, resource allocation, education, diagnosis and care.

W.H.P.23 COMPARISON OF EPIDEMIOLOGICAL DATA FROM THE AIDS-EPIDEMIC IN THE USA AND THE FRG

Schwartländer, Bernhard*; Schlittgen, R.**; Dobberstein, J.+ and Koch, M.A.

*AIDS-Center, Bundesgesundheitsamt, Berlin FRG; ** University Essen, FRG; +BIAS, Berlin, FRG

Objective: To compare the course of the course of the epidemic and clinical outcome of AIDS in the FRG and the USA.

Methods: Data from AIDS-register of the Federal Health Office and the US AIDS-programm of the CDC were analysed using standard statistical procedures, time series analysis and non linear regression modelling.

Results: In the FRG and the USA more than 80% of all AIDS-cases are homo-/bisexual men or IVDA's. In the FRG the relative proportion of IVDA's increased slowly from 8% to now 20%, while in the USA already early more than 20% of AIDS-cases came from this risk group with no increase apparent. Primary AIDS-manifestations in FRG are more often others than PCP. AIDS-associated malignancies were more often diagnosed in the FRG.

The development of the AIDS-epidemic follows identical patterns in the USA and FRG for comparable subgroups, however with delays in FRG varying from subgroup to subgroup. The course in the USA is best described by a non linear regression model with different points of inflection.

W.H.P.20 PARTICULAR FEATURES OF A LENTIVIRUS EPIDEMIC AND THEIR DYNAMIC CONSEQUENCES, SUCH AS TRANSIENTS, CRESCENTS, AND A 10 YEARS' MORATORIUM FOR THE DETECTION OF ERRORS

* MICHAEL G. KOCH, ** José J. Gonzalez, *** Dietrich Dörner, **** Pål Davidsen, ***** Johanna L'age-Stehr, ****** Ulrich v. Welck

* Vårdcentralen, S-546 00 Karlsborg, Sweden; ** ASA, N-4800 Arendal, Norway; *** Psychology II, University, D-8600 Bamberg, FRG; **** Institute of Informatics, University, N-5007 Bergen, Norway; ***** Robert-Koch-Institute, BGA, D-1000 Berlin 65, FRG; ****** ACS, D-8000 München 60, FRG.

HIV is, to the best of our knowledge, the first lentivirus ever to infect mankind. The long incubation period of up to 19 years and more (with an average of about 10 years) results in unusual phenomena such as "transients", "crescents", cumulative selection of malign virus variants, and a general delay of various dynamic effects. Even the visible outcome of saturation kinetics and an increasing potential of infectivity in recently infected, young virus carriers is considerably postponed. In a similar manner, our errors of today and ineffective or counterproductive measures have an "incubation time" of about 10 years, until the resulting course of events may lead to critical reevaluation of convictions and belated correction of erroneous actions. Computer based simulation may help to model and to understand these unfamiliar features of a new kind of human epidemic - and, thus, to predict its course correctly.

W.H.P.22 CHANGING TRENDS IN THE AIDS EPIDEMIC IN EUROPE

Downs, Angela M.; Ancelle-Park, R.A.; Brunet J.B.
WHO Collaborating Centre on AIDS, Paris, France

Objective: To monitor the evolution of the AIDS epidemic in Europe and to provide regularly updated snort-term predictions.
Methods: Numbers of AIDS cases per half-year of diagnosis reported by 30 June 1988 were adjusted for reporting delays and fitted to a piecewise-exponential model to obtain estimates of average doubling times (DT) over successive 3-year periods. Short-term predictions were made by extrapolation using latest estimated doubling times. Data were analysed for the European Community (pooled data), by country and/or by transmission group. Alternative trend extrapolation models are under investigation.
Results: Latest estimated DTs and cumulated predictions include:

	-------- European Community	-------	Individual countries
Transmission group	DT (months)	predicted to mid-1990	DT: range (n)
all combined	12.7	63 645	9.2 - 19.3 (11)
homo/bisexual	15.4	26 715	10.9 - 23.8 (6)
IV drug user	9.3	25 535	9.0 - 12.6 (5)
heterosexual	11.2	4 130	5.3 - 15.0 (4)

Overall doubling times continue to increase. Countries with longer doubling times are those in which the homo/bisexual transmission group predominates; in at least 2 countries the epidemic curve shows signs of flattening.
Conclusion: More rapid spread among IV drug users than among homo/bisexual males is confirmed; cumulated cases in these 2 groups may be equal in the EC by mid-1990. A recent rapid increase in cases attributed to heterosexual transmission noted in Italy may be evidence of spread from IV drug users to their non-IV drug using heterosexual partners. Results will be updated.

W.H.P.24 IT TAKES TWO TO TANGO BUT ONE INFECTS: EFFECTS OF NON-DISCLOSURE ON THE UNDER-ESTIMATION OF THE PRECEIVED RISK OF HIV INFECTION.

Ronny A. Shtarkshall* and Awerbuch T.**.
*The Hebrew University & Hadassah Faculty of Medicine, Jerusalem, Israel, **Harvard University, Cambridg, MA., U.S.A.

The effects of non-disclosure of either HIV infection or previous engagement of risk behaviors is studied through the use of a containers probability model
The basic equation for a single insertive sexual intercourse between two partners is as follows:

$$P = pr \times i$$

P - the probability of being infected in that specific encounter.
pr - the prevalence of HIV in the specific population or sub-population
i - the risk of being infected in a single sexual encounter with an infected person (this is sometimes referred to as infectivity).

An Underestimation Factor (UF) is derived from the equation. When the infectivity is assumed to be constant, the UF is shown to be equal to the ratio of the prevalence in the "assumed" population to the prevalence in the "real" undisclosed population.

$$UF = P_{aware}/P_{ignorant} = P_{infecting}/P_{being\ infected} = pr_{\text{"assumed"}}/pr_{\text{"real"}}$$

The equations are utilized to derive the UF for three unique cases and it is shown to range from 0.2-2 $\times 10^{1}$ in the case of an insertive anal intercourse between an HIV $^{+}$ and an HIV^{-} homosexual to 1×10^{4} in a similar case of a vaginal intercourse. This factor remains constant regardless of the number of sexual encounters between the same partners as long as ignorance prevails.
The discussion focuses on the implications of this derivation for education and social policy toward disclosure and non-disclosure in sexual encounters. It is shown that disclosure of relevant information in sexual encounters is perceived as essential in situations not relating to HIV infection.

W.H.P.25 DETERMINISTIC MODEL OF THE U.S.A. AIDS EPIDEMIC

Buzby, Bruce*; Ramey, J.
*University of Connecticut, Storrs, Connecticut, USA.

Objective. To calculate number of AIDS carriers in the USA as a function of time and assumptions about infection rates, mean of the incubation distribution, size of "at risk" populations, impact of behavior change, and rate of "at risk" population turnover.
Methods. A computer simulation models the infection process within and between eight at risk populations based on sexual, social, and biological factors. The carrier time series is calibrated with CDC's case statistics. Extensive sensitivity analysis isolates the important assumptions.
Results. Base study assumes size of at risk populations (Homosexual - 1,516,000; IV drug abusers-876,000), significant behavior change in the homosexual & bisexual population, and Weibull distribution with mean of 8 years. Units are thousands of carriers.

Description of cases		End of 1988	1990	1992	1994
I Base case:	Heterosexual men IV Drug	74	123	176	226
	Homosexuals & Bisexuals	566	623	645	631
	IV Drug Abusers	705	719	638	505
	Total number of carriers	1345	1465	1458	1363
II Size of populations reduced by 50% (Total)		909	893	806	691
III Size of populations increased by 50% (Total)		1564	1921	2009	1958
IV No Behavior Change in Homosexual & Bisexual		1766	2070	2052	1842
V Weibull dist. mean at 12.9 years (total)		2004	2132	2181	2184

Conclusion. Heterosexual men IV drug abusers are most rapidly growing "at risk" population. Behavior changes in this population would of course modify this result.

W.H.P.26 UTILIZING COMMERCIALLY AVAILABLE PC SOFTWARE FOR THE ANALYSIS AND MANAGEMENT OF CLINICAL TRIALS HIV DATA

Mackay, S. Rae, III*; Corey, L.*; Benedetti, J.*.
*ACTU, University of Washington, Seattle, Washington, USA.

Objective. . Facilitate analysis of complex clinical (detailed history and physical exams) and lab (routine chemistries, p24 antigen cultures, pharmacological) data in a cohort of patients followed over time from HIV studies. To utilize personal computer (PC) based statistical software for the analysis, and Data Base Management Software (DBMS) for the organization and storage of HIV related data. Integrate these two software application programs.
Methods. R:BASE for DOS(tm) is the DBMS used to structure and store the clinical data and laboratory results from one or more sites. The data structures that suffice for data collection are transformed into those that best satisfy the requirements for analysis. R:BASE is used to perform validity and consistency checking and descriptive statistics. Subsets of the data selected for study are then extracted from the database and input directly to SPSS/PC+(tm). Reporting of the results is then accomplished from either or both applications based upon the format requirements for the finished paper.
Results. The complex data relationships of longitudinal and repeated measure studies can be effectively managed and analyzed using PCs. The data storage and management limitations of SPSS/PC+ are overcome by employing DBMS. Interfacing R:BASE with SPSS/PC+ eliminates the need to hand enter data for further analysis. Examples of these techniques will be shown.
Conclusions. When the investigator has control over the data, results are achieved quicker and more accurately for publications. By using commercially available, as opposed to custom developed, PC software, the cost of managing and analyzing large amounts of complex research data is greatly reduced

Affectation des ressources
Resource Allocation

Th.H.P.1

AFFECTATION DES RESSOURCES MONÉTAIRES (C-SAM)

Lise Lanctôt, Directrice générale, Comité SIDA Aide Montréal, Montreal, QC, Canada.

Objectif. Faire part aux congressistes de la distribution des ressources financières attribuées par les différents paliers gouvernementaux aux organismes sans but lucratif qui luttent contre le SIDA, dans la province de Québec.

Méthode. Exposition/conférence
- a) distribution gouvernement fédéral
- b) gouvernement provincial
- c) autres ressources
- d) répartition interne

Résultats. Les services offerts selon les argents obtenus tout en étant respectueux de la mission et des objectifs de l'organisme.

Conclusion. Évaluation du rendement selon les ressources financières pour 1985-1989.

Th.H.P.2

THE ECONOMIC IMPACT OF AIDS: A PATIENT PERSPECTIVE

Jackson, Lois* and Fanning, M.*
*Toronto General Hospital, Toronto, Canada

Objective: To examine the economic impact of AIDS on the patient population.
Method: Semi-structured interviews were carried out with 25 AIDS patients in three different centers in Ontario - Toronto, London and Ottawa.
Results: Approximately one-half of the patients interviewed have been negatively impacted upon economically because of their health status. These patients tend to be in their twenties or early thirties and have not had well established careers or jobs. In most cases, those who have experienced a negative economic impact have been fired from their fulltime jobs because of their health status, or have been forced to quit because of poor health. In order to survive economically, they rely on social assistance (welfare, U.I.C. or family benefits), financial assistance from their family and/or free lance work when their health permits and when such work is available. AIDS patients who have not experienced a drastic reduction in income tend to be in their late thirties or older who have, or have had, well established careers or jobs. For these AIDS patients, withdrawing from the work force either temporarily or permanently has meant relying on sick leave or disability plans (the latter typically purchased through employers), and their income has only been reduced slightly, if at all.
Conclusions: The economic impact of AIDS varies across the patient population. Not all AIDS patients have experienced a negative economic impact because of their health status, but those who have tend to be younger patients who have not had well established careers or jobs.

Th.H.P.3

DISTRIBUTION AND CHARACTERISTICS OF AIDS HOSPITALIZATIONS IN THE U.S., 1986-87

Judy K. Ball, Ph.D.* and Barbara J. Turner, M.D.**
* National Center for Health Services Research, USDHHS, Rockville, MD, USA;
** Thomas Jefferson Medical College, Philadelphia, PA, USA

Objective. To investigate the characteristics of AIDS hospitalizations in 1986-87 in a large, nationally representative sample of U.S. hospitals.
Methods. The Hospital Cost and Utilization Project collects over 2 million discharge abstracts per year from a sample of 400+ short-term community hospitals across the U.S. AIDS discharges have been selected based on the presence of an AIDS diagnosis or PCP. Both patient and hospital characteristics are analyzed to provide a national view of AIDS.
Results. In 1986, adult AIDS discharges (N=3230 from 196 hospitals) were concentrated in the west (39%) and the northeast (36%), in urban areas (98%), and in larger than average (over 400 beds), private not-for-profit (86%), and teaching (86%) facilities. On average, length of stay and total charges were highest in the northeast (17 days, $12914), but charge per day, a measure of service intensity, was highest in the west ($995). AIDS discharges were most often covered by private insurance (54% versus 43% for all discharges) but were twice as likely to be covered by Medicaid (23% versus 11%). Only 6% of AIDS discharges reported Medicare coverage.
Conclusion. For policymaking at a national level, the view of AIDS must be expanded beyond New York and California. Substantial variations in patient characteristics and resource use are found when a large number of AIDS discharges from across the U.S. are considered.

Th.H.P.4

THE ECONOMIC IMPACT OF AIDS ON THE HEALTH CARE SYSTEM IN SWITZERLAND

Maurice R.H. Pedergnana, lic.oec., University of St. Gall. SWITZERLAND

Objective. To estimate the impact of all direct costs due to HIV infection and AIDS on the Swiss health care system and on the Swiss health care insurers by applying current epidemiologic projections (cum. 12,000 in 1995).
Methods. Analysis of medical and financial records of 60 AIDS patients (17% of all death cases), of governmental subsidies, and of other direct costs.
Results. Personal costs have been far lower than overall nonpersonal costs. This will change radically until 1995. Estimated lifetime costs were 74,000 Sfrs. per AIDS patient (including outpatient treatment). Health care insurers, who have generated much concern among policymakers, paid typically only 50 percent of all medical costs. The remaining costs consisted almost entirely of increased hospital deficits that were covered by taxes.

Direct Costs (in mio.Sfrs.)	1986	1987	1988	1991	1995
Personal Costs	6.0	8.0	12.0	60.0	225.0
Nonpersonal Costs	18.0	36.6	48.0	50.0	50.0
Total Direct Costs	24.0	46.6	60.0	110.0	275.0

Among nonpersonal costs, there had been expenditures for prevention & information (1986:1.5 mio. Sfrs., 1988:10.0), screening (7.0;7.0), HIV testing (6.0; 12.5), research (2.0; 10.0) and other expenditures (1.5; 8.5). By comparison, the impact of alcoolism (3.1%) and rheumatism (5.3%) on the health care system today is still far higher than the estimated impact of AIDS (1.0%) in 1995. The number of hospital beds required is low and will remain low (500 beds in 1995 or 1.0% of a all acute care hospital beds).
Conclusion. With cumulative 3,500 (12,000) AIDS cases expected until 1991 (1995), AIDS will have only minor resource implications on the health care system and will drain the coffers of the health care insurers only negibly.

Th.H.P.5

HOSPITAL UTILIZATION AND HOSPITAL EXPENDITURES FOR PATIENTS WITH HIV DIAGNOSES, UNITED STATES, 1984-1987

Mary Moien and Lola Jean Kozak, National Center for Health Statistics, Hyattsville, Maryland, USA

Objective. To present a national overview of hospital utilization and expenditures and the changes found over the period 1984-1987.
Methods. The data are from the National Hospital Discharge Survey (NHDS) and are collected from the medical records of a sample of patients in a national sample of over 400 short-stay general and specialty hospitals. For the 4-year period, 1984-1987, there were over 700 records with an HIV diagnosis. Estimates of annual hospital expenditures were computed using data on hospital expense per day from the American Hospital Association.
Results. Approximately 3/4 billion dollars were expended by short-stay hospitals in the care of HIV patients in the years 1986-87. HIV patients spent almost 1.4 million days in hospitals in 1986-87, compared to half a million days in 1984-85. The increased number of days was due to growth in the number of hospitalizations: 10,000 in 1984, 23,000 in 1985, 37,000 in 1986 and 49,000 in 1987. The average length of stay for HIV patients remained at about 2-2½ times the average for all patients (15.9 days vs. 6.4 days for all patients in 1987). In 1986-87, public sources, primarily Medicaid, were expected to provide payment for 40 percent of hospital days for HIV patients, compared to 25 percent in 1984-85.
Conclusion. Hospital use and costs for patients with HIV diagnoses are growing rapidly in the United States. Public funds are supporting an increasing proportion of hospital costs.

Th.H.P.6

Impact of Hospitalized H.I.V. disease in a low incidence area

G.D.Taylor, L.J. Miedzinski
University of Alberta, Edmonton, CANADA

Object: With 6% of the Canadian total of diagnosed AIDS cases Alberta is a low incidence area. To determine the impact on and distribution of H.I.V. disease within the 6 active treatment hospitals within the city of Edmonton, a medical records search was undertaken.
Method: Medical records analysts using PAS diagnosis indexes and ICD-9-CM codes 795.8, 279.19, 279.3 and 042.0 - 044.9 extracted hospital admissions and days of stay for all Edmonton hospitals 1985 through 1988. Data for 1988 was extrapolated to year end from available information.
Results: Hospital Days all HIV patients

Hospital	1985	1986	1987	1988*	total	%all days	%all Edmonton hospital beds
1 (UAH)	31	334	763	1512	2640	80%	29
2	89	32	165	120	406	12%	29
3	0	0	7	27	34	1%	12
4	0	66	37	4	107	3%	14
5	0	37	14	0	51	1.5%	14
6	0	0	70	0	70	2%	2
Total	120	469	1056	1663	3308	99.5%	100%

*estimated

Whereas provincially between 1985-88 there was a 180% growth in annual AIDS incidence, in Edmonton H.I.V. bed utilization grew 1385%; 78% of bed use by identified HIV patients was for AIDS.
Conclusion: Even in a low incidence area such as ours, impact of HIV disease has grown considerably. Growth in diagnosed AIDS cases has greatly underpredicted growth in in-patient days. Reasons for and consequences of the maldistribution of impact needs to be explored.

Th.H.P.7 A SYSTEMIC APPROACH TO AIDS ECONOMIC AND (SOCIAL) IMPACT ANALYSIS

Dr. BOUNYA-EPEE, Samuel Ph.D. The University of Yaounde, Cameroon

Our aim in this study was to construct indicators leading to a coherent planning (indirect) system by which to reveal obstacles to world distribution of scarce resources to do same things. If the same reallignment of AIDS founds can be worked by reading off these relative marginal efficiency rates in allocating mean to ends at all levels of hierarchical and functional autonomy (individual-nation-society-world), then the direct method of experimenting with and intended behavior or logical action constraints can be used as best method at solving the crucial problem of modern man or modern society plight for survival from a less and less congenial or cooperative environment.

Th.H.P.8 THE CANADIAN AIDS RESEARCH CONTRIBUTION: A CRITIQUE

Ronald, Allan R. Department of Internal Medicine, University of Manitoba, Winnipeg, Manitoba, Canada

Canadians are becoming involved in the international effort to control the spread of HIV, and to understand the biology of the agent and the host response to it. This is evident by a number of parameters including the number of abstracts at the International Symposia from 1985(1) through 1989 (over 40), and the major contributions to the world literature. In 1989-90, almost 5% of the total Canadian research effort or 17-18 million dollars will be allocated to AIDS research. What is this purchasing? What are the priorities for the future?

All AIDS researchers in Canada have been circulated with a questionnaire to identify Canadian contributions and determine future directions. The questionnaires are being collated. It is intended that this exercise will determine how AIDS researchers in Canada evaluate the contributions made to date, the direction and quality of leadership of the Canadian AIDS research effort, and priorities required for the future. This is a constructive critique with some guidelines intended to determine where we wish to be and how we plan to get there.

Th.H.P.9 LABOR PRODUCTIVITY LOSSES TO NEVADA'S AND THE AMERICAN ECONOMY RESULTING FROM PREMATURE DEATH DUE TO AIDS

Carwein, Vicky; Ray, C. University of Nevada, Las Vegas, Las Vegas, Nevada, U.S.A.

Objective. To determine the labor productivity losses to Nevada's and the American economy resulting from the premature disability and death of persons with AIDS by calculating the past and future lost income for all individuals with AIDS reported in Nevada during the years 1987 and 1988.
Methods. The past and future income losses were individually calculated for each individual in the population (N=209) based upon date of birth, sex, race, age at AIDS diagnosis, month and year of AIDS diagnosis, occupation and annual income. Past income loss was defined as the period between the date of diagnosis and December 31, 1988 and was determined by calculating the partial salary for the year of diagnosis if diagnosed in 1988. For those diagnosed in 1987 the partial salary for 1987 was added to the projected 1988 salary. Upon determination of each individual's work life expectancy future income losses were calculated by multiplying the 1988 annual income by a growth factor of 6.4% for each year of the remaining work life.
Results. The labor productivity loss to Nevada's and the American economy in past and future income adjusted for inflation for all (N=209) AIDS cases reported in Nevada during 1987 and 1988 was $305,929,724. Past income loss was $4,654,398 and future income loss was $301,275,326. In constant 1988 dollars the total lost income is $117,567,218.
Conclusion. AIDS is having a serious impact upon the productivity of the labor force in Nevada and the United States. Billions of dollars will be lost to the American economy over the next few years as a result of the premature disability and death of persons with AIDS.

Th.H.P.10 STUDY ON CONSUMPTION OF CARE OF HIV-POSITIVE PATIENTS

Bo R Nilsson*, Knut Lidman**, Harriet Malmquist*** et al.

* Department of Cancerepidemiology, Karolinska sjukhuset.
** National Bacteriological Laboratory. *** National Swedish Board of Health and Welfare. Stockholm, SWEDEN

Objective. A follow-up study to estimate the consumption of institutional and non-institutional care of patients with HIV/AIDS and to study the changes in consumption over time.

Method. Two random samples of HIV/AIDS patients reported to the nation wide register of National Bact.Lab. before 1986-07-01 (1:st sample) and after 1986-07-01 (2:nd sample) were drawn.

Conclusion. The consumption of institutional and non-institutional care for HIV/AIDS patients can be estimated. When forecasting the need of care, the results from the studies can serve as a basis of facts.

Results. The follow-up study (the 2:nd sample) is going to be reported preliminary in June, 1989 and compared with the first one. Parts of results from that study show that the estimated yearly number of days of institutional care for AIDS patients was 178 per patient. For patients without developed AIDS, the corresponding number was 5.9 per patient. The estimated, yearly number of non-institutional care for AIDS patients was 17.1 per patient; 6.0 for HIV patients.

Th.H.P.11 Medical Consumption of HIV patients outside hospital in France, an analysis in terms of gravity level

TRIOMPHE A., FLORI Y.A., BRUCKER G., GUTBRAU P.
Laboratoire d'Economie sociale 90 Rue de Tolbiac 75634 Paris cedex 13 France

The aim of the study was to estimate the structure of the medical consumption of patients with HIV infection according to their seriousness level, seropositive or AIDS and to the prescription.
This study was conducted in Paris and Lyon, during 1988 :110 patients (90% men) were recruited and filled up a questionnaire that was given in ambulatory consultations or at the general practionners. After acceptation by the patient, the specialist or general practionner noted the seriousness level on the back of the questionnaire according to a check list (four cases). The questionnaire included : the number of ambulatory consultations (general practionner and specialist), the cost of drugs and biological examinations, the number of stay at hospital and some items about the professional life.
The main results are : there is a significant difference between the structure of the consumption of, the seropositive AIDS patients. This effect is an accumulation effect, non substitution one (e.g. : from 1.3 to 4.5 G.P. consultations for 3 months, and from 235 to 635 FF for the drugs). In the beginning of the disease, the G.P. are autonomous for their prescriptions while they are in synergy with hospital specialists when their patients fall in AIDS disease.
There is no effect of the participation to a therapeutic trial in terms of consumption outside of hospital because expensive drugs are given only by hospitals.
Most of the patients included in the sample are working (80% of seropositive and 55% of AIDS patients). Patients at work consume less consultations of G.P.
The direct cost of care outside hospital (according to the Social Security prices) is :
7 390 FF (around $ 1211) for each seropositive patient (1 022 paid by the patient) ; for AIDS patients, the direct cost is 8 534 ($ 1400, 916 FF paid by the patient)

Th.H.P.12 A COMPREHENSIVE AND COST-EFFECTIVE APPROACH TO THE MANAGEMENT OF AIDS PATIENTS IN AN OUTPATIENT CARE FACILITY: THE RESULTS OF A PATIENT SURVEY.

Benitez, Raúl, Sotomayor, Jeannette., San Juan AIDS Institute, Hato Rey, PR

At present time, Puerto Rico is in the list of the first eight countries in the world with the greatest number of AIDS cases reported by population density and the second in Latin America. Recent projections suggest that by the year 2,000, the cumulative number of AIDS cases in San Juan will be between 50,000 and 150,000- this is a metropolitan region of approximately 0.5 million people. Also, it has been estimated that 50% of the cases reported in Puerto Rico belong to the city of San Juan. The San Juan Department of Health developed a policy statement entitled "Alianza para la Salud", which explicitly encouraged the cooperation of public and private sectors in the provision of health care.
Following this policy, a cost-effective approach to the management of AIDS Institute, a private corporation formed in December 1987. It receives funds from the municipality under a contract to provide services, and its main purpose is to offer alternatives to in-patient and outpatient care, to emphasize in preventive meassures and reduce the costs of in-patient care.
As part of its main functions, the Institute provides ambulatory care at its main facilities, located in a third floor of a municipal local health center, which provides care to adult and pediatric patients, other than AIDS patients. Last year 1,719 patients were evaluated and treated as ambulatory care. 60 patients were picked at random, in a one month period, and asked to fill a questionnaire that meassured basically, quality assurance and patient's perception of services being offered. Final results disclosed a 95% (N=56) of satisfaction regarding quality of service and 93% of satisfaction in medical treatment received. 86% (N:51) felt confidentiality was assured and 88% (N:62) evaluated personnel as qualified or highly qualified in AIDS. 53% felt less anxious ever since they visited the Institute and more than half of seropositive drug addicts in group therapy were drug free and less concerned about course of future illness. Results of this study are indicative, that in spite of social stigma of high risk groups, space limitations, and reduced human resources in a large catchment area, the San Juan AIDS Institute has succeded in providing cost effective, high level care to AIDS patients in San Juan.

Th.H.P.13 ENLISTING THE SUPPORT OF TRADITIONAL HEALERS IN AIDS EDUCATION CAMPAIGN

B.U. CHIRWA AND E. SIVILE
MINISTRY OF HEALTH P.O. BOX 30205 LUSAKA ZAMBIA

A nationwide AIDS education campaign in Zambia was constrained by lack of support from traditional healers. Firstly some of them did not appreciate the nature of the new disease, and secondly others hampered the education efforts by publicity claiming that they possess curative and/or preventive medicines for HIV infection.

To overcome communication barriers, the health education unit convened a workshop for traditional medical practitioners and their orthodox counterparts. An important feature of the workshop was interactive participaroty small group discussion. At the close of the workshop significantly more healers understood the nature of AIDS and were willing to participate in the national information and education effort against AIDS.

Th.H.P.14

Th.H.P.15

THE FEAR OF AIDS IN YOUNG WOMEN

G. Sakellaropoulos, G. Iatrakis, G. Kourounis, Em. Argyroudis
Department of Obstetrics and Gynecology, Athens, Greece

The purpose of this study was to investigate the possible fear of Acquired Immune Defficiency Syndrome (AIDS) in young women with or without suspective clinical findings.
Material and Methods: 48 young women with more than one sexual partners during the last 3 months were interviewed about their fear for the possibility for carrying human immunodeficiency virus.
1st group) 36 women had no clinical findings. 2nd group) 12 women had clinical abnormalities as weight loss, fevér, fatigue, arthralgia, anorexia and diarrhea.
Results: 1st group)12 women(21.4%)complained about there fear for having AIDS.
2nd group)10 women(83.3%) complained about the same fear.
The difference is statistically higly significant between the groups($p<0.01$).
Conclusion: The fear of having AIDS is very high in young women with more than one sexual partners and with clinical abnormalities.

Th.H.P.16 ETUDE DU TEMPS MOYEN DE SURVIE DES PATIENTS ATTEINTS DE SIDA A KINSHASA/ZAIRE.

KAYEMBE KALAMBAYI MD, MULUMBA M.P. PhD, TONDUANGU K. MD
Clinques Universitaires Kinshasa, B.P 15804 Kinshasa I Zaïre.

Objectif:Evaluer le temps moyen de survie des sidéens afin d'établir des critères de base pour l'évaluation de l'efficacité des nouvelles thérapeutiques en expérimentation.
Méthodes et patients:Les dossiers des malades décédés avec le diagnostic de SIDA (Clinique + ELISA+) de Jan 84 à Nov 87 aux Cliniques Universitaires de Kinshasa ont été revus. Le temps moyen de survie est défini comme l'intervalle du temps écoulé entre la date de début du 1er symptôme et celle de décès.
Résultats:99 dossiers des décès dus au SIDA (56♂,43♀) ont été retenus.L'âge moyen des hommes (moyenne + ET :37,1 +/-9,1 ans) était plus élevé que celui des femmes (29,3 +/-7,4 ans) p<0,00001.La survie moyenne des femmes (374,1 +/- 282,4jrs; extrêmes:63-1525) est plus élevé que celui des hommes (249,9 +/- 238,2 jrs; extrêmes: 12-1051) p=0,03. L'étude des percentiles montre les 25^{e} 50^{e} 75^{e} respectivement de 124, 230 et 500 jrs pour les femmes et 92, 188 et 314 pour les hommes.
Conclusion:50 % des sidéens ne survivent pas plus de 6 mois après le début du 1er symptôme. La survie moyenne des femmes avec SIDA semble plus longue que celle des hommes.Une étude est en cours afin de déterminer les différents facteurs qui influencent la survie.

Th.H.P.17 INCIDENCE D'INFECTION HIV-1 DANS PROSTITUEES DE CALLAO, PEROU. ETUDE DE COHORTE.

Alarcón, Jorge *; Palacios O.*, Tejada A.*; Phillips I.**, Varela L.***
* Universidad Nacional Mayor de San Marcos, ** NAMRID,
*** Population Council

Objetif. Déterminer l'incidence d'infection HIV-1 dans une population de prostituées de Callao, Pérou.
Méthodes. On a selectionné une cohorte de 575 prostituées controlées dans le Centre de Santé de Callao, Pérou. Dans ce groupe, par les techniques de ELISA et WB, on a determiné la prevalence d'infection HIV-1. Six mois après, par les memes techniques, on a determiné les nouveaux cas. On a prévue la réalisation de une 3éme enquête à la fin du 12éme mois de surveillance.
Résultats. La prevalence d'infection HIV-1 fut de 0.003 (Abr. 1988). Dans la période de 6 mois on a enregistré un nouveau cas, ce qui donne une incidence de 0.001 (Oct.1988). Dans cette même période, il y a eu des changements dans le nombre et la composition de la cohorte; ce qui va être corrigé pendant l'enquête final. De la même maniére, dans cette période, on a appliqué un programme de prevention dans cette cohorte.
Conclusion. L'incidence d'infection HIV-1 dans ce groupe est bas par rapport à ceux qui on observe dans des autres groupes à risque. La différence relative peut s'expliquer par la particularité du comportement du virus dans cette population ou par l'impact du programme de prévention.

Th.H.P.18 UTILISATION D'UN TEST RAPIDE AU LATEX POUR PREVENIR LA TRANSMISSION DU HIV PAR TRANSFUSION DANS LES SOINS DE SANTE PRIMAIRES A KINSHASA.

Gerniers,Marie*; Kabeya,M.**; Kasali,M.**; Pauwels,P.***; Perriens,J.**.
*Projet Santé pour Tous, **Projet SIDA, ***BNT; Kinshasa, Zaire.

Objectif. Evaluer l'utilisation d'un test rapide effectué par un personnel non spécialisé dans 5 centres aux ressources limitées ne disposant pas de banque de sang.
Méthode. 726 donneurs de sang ont été recrutés consécutivement pour l'enquête. Tous les donneurs ont été testés par le test rapide d'agglutination au latex (Cambridge Bioscience)(L), effectué par le personnel infirmier préalablement formé pendant 15 jours au labo du Projet SIDA. Sur 428 échantillons consécutifs 364 ont été controlés par ELISA (Organon ou Wellcozyme)(E). Ont été considérés comme Vrai Pos(VP): 1L(+) avec 2E(+), Vrai Nég(VN):1L(-) avec 1E(-), Faux Nég(FN): 1L(-) avec 2E(+), Faux Pos(FP): 1L(+) avec 1E(-). Un Western Blot (DuPont)(WB) a pu être fait sur 6 sérums discordants soit entre L et E soit entre 2E, si fait, le résultat du WB a prédominé pour l'analyse.
Résultat. 61(8,4%) des 726 donneurs étaient L(+). Parmi les 428 échantillons 62 ont été éliminés: 59 L(-) dont l'E manquait et 3 L(+) avec un seul E(+). Sur les 364 échantillons restant 31(8.5%) étaient L(+); il y avait 18 VP, 331 VN, 2FN et 13 FP. La sensibilité du test est de 90 % ±1,6; sa spécificité de 96,2% ±1,0.
Conclusion. Un test rapide peut être utilisé pour prévenir la transmission du HIV dans les services de soins de santé primaires en Afrique.
La sensibilité du test dans les conditions du terrain est plus faible que prévu.

Th.H.P.19 PEAK PREVALENCE OF HIV IN NAMIBIAN TEENAGERS

Lecatsas, G.[1]; Joubert, J.J.[2]; Schutte, C.H.J.[3]; Taylor, M.B.[4] and Swanevelder, C.[4].
1. Department of Microbiology, Medunsa, Pretoria, South Africa
2. Department of Microbiology, University of Stellenbosch, South Africa
3. RIDTE, MRC, Durban, South Africa
4. Department of Medical Virology, University of Pretoria, South Africa

Objective. To determine the prevalence of HIV-1 and HIV-2 antibodies in a series of 708 serum specimens collected in the east Caprivi area of Namibia.
Methods. Elisa (Elavia and Du Pont) and Western blot techniques were used to investigate and confirm respectively the prevalence of antibodies to HIV-1 and HIV-2.
Results. Half of the HIV-1 positive specimens were from teenagers and younger. A significant difference in HIV-1 positivity between the two Elisa tests was found (4.2% by Elavia, 5.6% by Pasteur). On confirmation by Western blot, a false positivity rate of approximately 50% for both Elisa tests was demonstrated. No HIV-2 positives were confirmed although 15 of 704 (2.1%) HIV-2 Elavia positives were detected. Four false negative results were obtained (4/708, 0.6%).
Conclusions. In contrast to other countries, Namibian teenagers form the largest group of HIV-1 positive individuals. The high degree of false positivity suggests the presence of cross reacting antigens in this area. The detection of false negatives indicates the need for more careful evaluation of test results.

Th.H.P.20 AIDS AND MIGRATION IN JALISCO, MEXICO: THEIR RELATION WITH RISK FACTORS.

Diaz- Santana, David* and Celis,A.**
*Consejo Estatal para la prevencion del SIDA en Jalisco.
** Instituto Regional de Salud Pública, U.de G.,Guadalajara, Jalisco, México.

OBJECTIVE: To describe migration backgrownd in the 250 AIDS patients reported in Jalisco, México, up to december 31,1988, and its relation to risk factors.

METHODS: Information supplied by the reports of AIDS cases in Jalisco. Analisys focused on travel to foreign countries and high risk practices.

RESULTS: Of the 250 case reported, aproximatly 50% traveled to foreign countries. Analising by sex and sexual habits the percentage modifies significantly.

CONCLUSION: A strong association was found with males and travel to foreign countries, this is stronger with homosexuals, at the beginning of the epidemic this relation was more frequent.

Th.H.P.21 HTLV-I INFECTION IN SEXUALLY ACTIVE AND HIV-I INFECTED SUBJECTS IN THE PHILIPPINES

Ofelia T. Monzon, FJE, Paladin, S.S., Mohammed, C. Lazo, J.M., Capellan
Department of Health Research Institute for Tropical Medicine, Philippines

Objective. To determine the prevalence of HTLV-I infection among subjects at risk for or with HIV infection.
Methods. Sera were collected from subjects in Metro Manila being surveyed for HIV-I antibodies and HIV infected subjects under followup. Testing for HTLV-I was performed with particle agglutination(PA) and Western Blot(WB) methods. HIV-I antibodies were detected with PA and immunofluorescence tests.
Results. A total of 696 samples were tested for antibodies to HTLV-I and HIV-I. The age range was 18-57 years; most were females; originally from different islands; and with many sex partners from other countries. 662(95%) samples showed no antibodies to both HTLV-I and HIV-I on screening tests. 11 HIV negative samples had HTLV-I antibodies on the screening test: WB tests were negative in 6 and indeterminate in 5. Repeat WB studies in another laboratory showed no antibodies in the latter samples. Among the 23 HIV-I seroreactive samples, no antibodies to HTLV-I were seen on PA screening. There were no positive WB tests.
Conclusion. HTLV-I antibodies do not appear to be prevalent among the subjects studied. Further studies are needed to determine the significance of indeterminate WB results. However, additional serological surveys are necessary to establish the prevalence of HTLV-I among other population groups.

Th.H.P.22 MODES DE CONTAMINATION DES ENFANTS A POINTE NOIRE (CONGO)

NICOLAS-RANDEGGER J.**, BRUNET L.*,
MBOUNGOU-KIMPOLO S*, BALENDE J.*

* Service de pédiatrie et maladies infectieuses
Hôpital A. SICE POINTE NOIRE (CONGO)
** Unité d'immuno-hématologie Hôpital ROBERT DEBRE
48, boulevard Sérurier 75 019 PARIS

OBJECTIF : déterminer le mode de contamination des enfants hospitalisés pour SIDA dans le service de pédiatrie de Pointe Noire afin d'en déduire des méthodes de prévention.

METHODES : Tous les enfants atteints de SIDA hospitalisés du 01/01 au 30/04/1988 ont fait l'objet d'une enquête, d'un examen clinique et d'une sérologie VIH, de la mère et de l'enfant. L'interrogatoire a défini :

- les circonstances de la naissance, à domicile et en maternité, les vaccinations reçues, le nombre d'hospitalisations et de transfusions avec l'identité des donneurs, l'existence d'injections intramusculaires ou intraveineuses antérieures, de scarifications traditionnelles, de circoncision et de perçage des oreilles, le mode d'allaitement et l'existence d'autres malades ou décès suspects de SIDA dans la famille.

RESULTATS : Les modes de contamination ont été analysés chez 154 enfants : 64,3% sont contaminés par leur mère ; 16,4 % par des transfusions ; 8,3 % sont indéterminés ; 17 enfants, soit 11 %, non transfusés, dont la mère est séronégative, ont comme seul facteur de risque des antécédents d'effractions cutanées avec un matériel contaminé (injections, prélèvements, scarifications, vaccinations, etc).

CONCLUSION : L'importance de la contamination par effraction cutanée a conduit à une révision des attitudes thérapeutiques vis-à-vis du paludisme et des anémies, à une formation du personnel de santé et à l'organisation d'un programme d'éducation sanitaire.

Th.H.P.23 HIV-INFECTION IN HETEROSEXUAL POPULATION:PARADOX OR CONCEALMENT OF INFORMATION?

Cahn,Pedro*;Pérez,H*;Casiró,A*;Grinberg,N*;Bouzas,M**; Muchinik,G**.
*Hospital Fernández,**IIHEMA,Academia Nacional de Medicina,Buenos Aires, Argentina.

Objective. To perform a comparative analysis of the prevalence of HIV-reactive subjects on 2 populations:one with HIV-reactive individuals repeated contact (P1),and the other with multiple sexual partners(P2)of unknown HIV serology.
Methods. A total of 269 patients(Pt)without a history of homosexuality,IVDA, hemophilia or transfusion was studied (P1:18 men(M),96 women(W)=114 Pt; P2: 106 M,49 W=151 Pt). Sera were asssyed through ELISA HIV-1 Abbott and confirmed through Immunofluorescence and/or Western Blot.
Results. Table I shows seroprevalence data.

	Men			Women		
	No	HIV+	%	No	HIV+	%
P1	18	-	-	96	12	12
P2	106	11	10	49	7	14
TOTAL	124	11	9	145	19	13

P1 W's partners were as follows:

	No	HIV+	%	
Bisexuals	7	1	14	
IVDA	58	6	10	p = ns
Hemophiliacs	31	5	16	

Conclusion. Heterosexual transmission is also confirmed in this population, where it shows a slight preponderance of M-W over W-M. Upon comparison of HIV +Pt risk group, no significant differences were found among their female partners. It is not clear whether P2 has seropositiveness levels higher than those of P1, a paradox that could be due to possible concealment of past epidemiological risk. This fact must be explained through subsequent studies.

Th.H.P.24 TYPOLOGY, BEHAVIOR, BISEXUALITY AND HIV INFECTION OF HOMOSEXUAL MEN OF COSTA RICA, 1985-1988

Mata, Leonardo*; Ramirez, G.*; Badilla, J.*; Mata, E.*.
*INISA, University of Costa Rica, San Pedro, Costa Rica.

Objective. A cohort was established to study risk factors and incidence of HIV-infection.
Methods. Healthy homosexual volunteers participated. Confidentiality, informed consent, and freedom to withdraw from the study at any time was assured. Each man was interviewed and tested by an ELISA and confirmed with Western blot. Three of five "types" of homosexual men in the country were represented: openly "gay" and "cryptic" (not publicly gay) (N=547); "male prostitutes" (N=95); and "homosexuals in prison" (N=61).
Results. 1) HIV infection remains confined to the gay and cryptic men (12% HIV-positive). Very few infections have been recorded in male prostitutes or in men in prison. 2) Bisexuality: 13 per cent of gays and cryptic men, and 33 per cent of male prostitutes said they were bisexual. 3) HIV infection by sexual preference: 12 per cent of exclusively homosexuals and 9 per cent of bisexuals were infected. 4) Behavior was similar in all "types", but differences in intensity and occurrence of sexual practice varied.
Conclusion. Our epidemic follows Pattern 1; two women with heterosexually acquired AIDS appeared in 1988 (4% of total). The presence of HIV in many bisexual men forecasts an increase of AIDS in women in the near future.

Th.H.P.25 HIV-1 AND HIV-2 SEROLOGICAL STUDY CARRIED OUT ON BLOOD DONORS FROM GUINEA BISSAU

Sergio Sabbatani, M.Ghidinelli*, A.M.Visintainer*, B.Biasioli**, P.J.Mendez***, F.Diaz**** - Ospedale Maggiore Bologna. ITALY. * Centro Hemoterapico - Simao Mendez Hospital - GUINEA BISSAU. ** Laboratorio Analisi, Ospèdale Borgotrento Verona - ITALY. ***Dt.Pr.Luta contra SIDA. **** Dt.G.Saude Publica - GUINEA BISSAU.

Objectif To evaluate if exist an increase of HIV$_2$ seropositivity in blood donors of Guinea Bissau in the comparison of the data collected during the first six months of activity with those regarding the second six months.

Material and methods The presence of specific HIV$_1$ and HIV$_2$ antibodies was investigate in 1766 blood donors (in majority relatives of pts admitted to Bissau Hospital); 1614 males, 152 females, average age 31.5 years. The statistic study was performed by means of Chi Square Test. The sera were tested with Elavia Pasteur Kit.

Results:

	BLOOD DONORS	HIV$_2$ POSITIVE	%	P
I° SIX MONTHS	720	54	7.5	
II° SIX MONTHS	1046	102	9.7	N.S.

Average age of HIV$_2$ Ab positive patients is 34.4 years. Out of 1766 patients, 7 resulted HIV$_1$ positive (0.39%).

Conclusion The study show a large number of HIV$_2$ Elavia reactive sera but no statistic significant prevalence of seropositivity in the comparison of two groups.

Th.H.P.26 AIDS SURVEILLANCE IN SICHUAN, CHINA

Dongyou, Yan; Chen, L; Lu, B; and Deng, P.
Health and Anti-Epidemic Centre of Sichuan Province, Chengdu, Sichuan Province 610031, People's Republic of China.

Objective. To monitor introduction of AIDS from the outside world.

Methods. We used antigen slides of T-cell line infected with HIV and indirect immunofluorescent antibody technique(IFA) for the detection of antibodies against HIV in sera of persons at high risk.

Results. So far, in our laboratory 1,327 sera collected from high risk groups of AIDS including Chinese workers coming back from Mideast and African countries, Chinese and foreign businessmen, students, visiting schoolars, and others coming in and going out of China between January 1987 and November 1988 were tested by IFA. No positive result was obtained.

Conclusion. To date, 19 AIDS cases have been found in China and among them no AIDS case of native Chinese who was infected by HIV through homosexual and/or heterosexual intercourse was discovered. Because of dramatic increase of prostitutes in Sichuan Province and of the incidences of sexual transmitted diseases, sooner or later, AIDS will be introduced in the native population in China and more recently a sera collected from a young service girl working at a hotel in Wuhan city in Hubei Province was found to be sero-positive by IFA and other tests. It is an unavoidable task for us to enhance AIDS surveillance in our Province and it is urgent to obtain support and collaboration from scientists and individuals engaging in AIDS in the world.

Th.H.P.27 PREVENTION OF TRANSFUSION ASSOCIATED HIV TRANSMISSION IN KINSHASA/ZAIRE

Jaeger, Helmut*; Nseka,K.**; Perriens,J.***; Kabeya,C.***; Neuhaus,G.*; Peyerl,G.*; Ryder,R.***; Rehle,T.*;
*Deutsche Gesellschaft fuer technische Zusammenarbeit (GTZ), Eschborn, Germany; **Hôpital Mama Yemo, Kinshasa, Zaïre; ***Projet SIDA, Kin., Zaïre.

Objective. To develop a strategy in order to prevent transfusion related HIV - transmission.

Methods. Between 5/9/88 and 19/10/88 1044 consecutive patients on whom staff physicians requested a transfusion from Mama Yemo Hospital Transfusion Centre (Donor-HIV-Seroprevalence: 4.8%) where examined and interviewed by physicians.

Results. Indications of blood transfusions:

Diagnosis	Age<5 (N=460)	Age 5-14(N=125)	Age 15-39(N=363)	Age=>40(N=96)
Malaria	77.0%	58.4%	14.0%	15.6%
AIDS	0.9%	1.6%	15.2%	19.8%
Pregn.rel.Complicat.	0.0%	0.0%	43.3%	3.1%
Sickle cell anaemia	5.2%	20.8%	5.8%	1.0%

955 patients were transfused; 22.7% (N=214) without laboratory results (hemoglobin or hematocrit). 71.2% of these requests without lab. results occurred in patients >15 years of age. 30.8% of these transfusions where due to pregnancy related complications. 7.2% were transfused with Hb >6g% or HCT >25% ; 16.6% with pulse <100 without signs of dyspnoea.

Conclusion. Two groups have a high risk of acute anaemia requiring blood transfusions in Kinshasa: 1. children <5 years of age with malaria, 2. pregnant women. To reduce the number of blood transfusions in Kinshasa, two main approaches can be used: 1. More effective control of malaria, 2. Development and implementation of strict transmission guidelines particularly in the obstetrical service.

Th.H.P.28 AIDS IN EGYPT
AN EPIDEMIOLOGICAL STUDY

Wassif, S.M.*; Mobarak, A.B.**; Rashed, A.S.***& Wassif,O.M.*
* Zagazig University; ** Ministry of Health; *** Military Medical Academy, Egypt.

AIDS, is a multifaceted problem with social, economic, political and medical implications.

The Ministry of Health in Egypt discovered 36 cases of the syndrome (20 foreigners and 16 Egyptians) by the year 1988. However,this may be only the tip of the iceberg.

National widespread screening of the syndrome started and all the discovered Egyptian cases were imported from abroad and they catched the infection during operation or blood transfusion.

Distribution and determinants of the syndrome in Egypt were presented and interpreted.

The suggested National Programme for Community Health action was discussed.

Th.H.P.29 AIDS EDUCATION FOR COMMERCIAL SEX WORKERS IN HONDURAS

Coello, M*, Bailey, P**, Janowitz, Barbara**, and Clarke, K.**
*Ministry of Health, Tegucigalpa, Honduras; **Family Health International, Research Triangle Park, North Carolina.

Objective: To provide education on STDs including HIV infection to registered commercial sex workers (CSWs) in Tegucigalpa, Honduras, and to evaluate the impact of the program on risk reduction behavior.

Methods: Registered CSWs are required to attend health clinics weekly. In this program, CSWs were provided with education on STDs and HIV and with a weekly supply of condoms. The intervention, which involved the participation of the CSWs in the development of materials, has been completed.

Results: Baseline data show that about 85% knew that HIV was transmitted sexually and condoms reduce risk. 86% have used condoms. Of condom users, virtually all have used them with clients, but only 25% of the 30% with non-client partners report condom use. CSWs report that over 40% of clients do not want to use condoms. Over 90% report condom breakage as a problem. 6% report anal sex. Final tabulations will show the impact of the education program on sex practices and condom use.

Th.H.P.30 AIDS PREVENTION AND IT'S COUNTERCURRENTS IN ASIA

Shahul Hameed Ebrahim* and D.Hilhorst**
* Bicol Christian College of Medicine, Legaspi City Philippines. **Social Worker, The Netherlands.

Objective. To assess the magnitude of AIDS prevention and its limitation in Asian Countries.

Methods. The following Asian Countries were chosen for the study Hongkong, India, Philippines, Singapore and Thailand. High risk groups (prostitutes, entertainers, homosexuals and IV drug users) AIDS counselling agencies, public health authorities and health care workers were visited and interviewed. Datas, opinions, suggestions and responses were evaluated.

Results. In Asia, the awareness of the potential thread and facts about the disease is very limited. The main source of information is the newspaper. Many still consider AIDS as a disease of foreigners. Even among the high risk groups, preventive measures are not a priority. For many prostitutes, survival is the main concern. Inadequate health resources and other health priorities make an effective AIDS program and screening unaffordable.

Conclusion. The potential for widespread dissemination of HIV infection in Asia is evident. Urbanization, prostitution & changing moral values, emerging from poverty and unemployment supported by growing entertainment and tourism industries make Asia vulnerable for HIV spread. Effective AIDS prevention and screening programs is apparently beyond the socioeconomic limits for many Asian countries.

W.B.O.45.A PEPTIDE T PHASE I STUDY:NEUROPSYCHIATRIC RESULTS

Goodwin, F.K.*, Bridge, Peter,*, Heseltine, P.N.R.**, Eaton, E.**, and Parker, E.S.**
*National Institute of Mental Health, Bethesda, MD.,
**University of Southern California, Los Angeles, CA., U.S.A.

Objective. To evaluate the toxicity and possible response measures to Peptide T (D-ala-1-peptide-T-amide), a homologue of VIP and gp-120, and gp-120 receptor blocker. Methods. In this ongoing study, 4 AIDS and 5 ARC patients received escalating fixed IV doses of Peptide T (.06-.8mg/kg/day) or intranasal (25 mg/day) without other antivirals. Baseline/repeat neurotoxicity measures were taken. Results. Pruritis in 1 patient led to early drug withdrawal. No neurotoxicity was observed. Individual responses to neuropsychologic testing varied from <0.5 to >1.5 S.D. increments across the 12 week testing period with variable decrements after drug withdrawal. Immuno/virologic drug responses were seen in as many as 5/9 patients. Cognitive neuromotor benefit and reduction of HIV constitutional symptoms on drug were greatest in those patients with immuno/virologic improvement. Conclusion. Peptide T was well tolerated for 12 weeks, with increases in body weight and well-being noted. Preliminary results indicate that these measures and immuno/virologic tests may be useful efficacy parameters for Phase II testing of Peptide T.

W.F.O.24 ETHICAL AND POLICY ISSUES POSED BY THE USE OF COERCION TO COMBAT THE SPREAD OF HIV INFECTION

Bayer, Ronald; Columbia University, School of Public Health, New York, NY, USA.

From the beginning of the AIDS epidemic there have been calls for the use of the State's power to quarantine to halt the spread of the lethal infection. But because it was quickly established that HIV infection was not casually transmitted the wholesale reliance on isolation was deemed unnecessary from a public health point of view, contrary to the principles of ethics that require respect for freedom, and undesirable from a public policy perspective. Troubling, however, was the question of how to respond to infected individuals who continued to act in ways that posed a threat to unsuspecting sexual or needle sharing partners. This has been the dilemma of those committed to a voluntaristic approach to controlling AIDS. There is, however, one national model of AIDS control that rejects the premises of voluntarism and that has determined that all HIV infected individuals must be isolated to prevent the possibility of behavioral transmission. The Cuban model stands as a bold and disturbing example of the exercise of public health powers to the exclusion of all other social values. This presentation will discuss the Cuban challenge and drawing on the experience of the United States, Sweden, Bavaria and South Africa analyze its relevance to other nations.

Th.E.O.6.A BLEACHMAN: A SUPER-HERO TEACHES AIDS PREVENTION

Pappas, Les*; Durazzo, R.*; Napolis, A. J.**
*San Francisco AIDS Foundation, San Francisco, CA., USA;
**Mid-City Consortium to Combat AIDS, San Francisco, CA., USA

Objective. To educate IVDUs about the risk of HIV transmission and the effectiveness of using bleach to clean hypodermic syringes. To motivate IVDUs to adopt safe needle using and sexual behaviors to limit the spread of HIV. Methods. A super-hero character was developed with extensive use of focus groups and field testing. BLEACHMAN appears in posters, brochures, billboards, bus cards, newspaper ads, television commercials, and on t-shirts. He also appears live (in an 8 foot super-hero costume with a bleach bottle for a head) and leads regular street outreach efforts. On the streets, accompanied by t-shirt wearing volunteers, BLEACHMAN talks to IVDUs and distributes bleach and condoms. BLEACHMAN has attracted the attention of IVDUs and their partners as well as extensive coverage in the media. Results. 89% of 165 randomly selected IVDUs have been reached by this AIDS prevention campaign. Of the IVDUs who acknowledged sharing needles (80% of the total group) 87.7% reported they were more likely to use bleach to clean their needles as a result of their exposure to BLEACHMAN. Conclusion. The ability to reach IVDUs indicates the effectiveness of this combined grass-roots and media strategy. BLEACHMAN represents a unique interactive approach to AIDS prevention. This is the first time IVDUs have had a hero who cares about their well being and they have responded with appropriate knowledge and behavior changes. AIDS prevention campaigns aimed at IVDUs can be effective if they are non-threatening and respectful of the target population.

Le Counseling
Counselling

11:00		Introduction: Ken Morrison
11:10	M.I.V.1	**"TALKING ABOUT AIDS"** Vidéo de/Video by: British Medical Association Foundation for AIDS Année/Year: 1988
11:33	M.I.V.2	**"PRE AND POST HIV TEST"** (en français, Rwanda), (in French, Rwanda) Vidéo de/Video by: Suzan Muska Norwegian Red Cross Année/Year: 1989

Le counseling est devenu un élément capital dans les traitements médicaux ou le dépistage d'anticorps reliés au SIDA. L'intervenant doit aider les personnes atteintes à comprendre l'infection par le VIH, ses modes de transmission et ses possibilités de traitement; il doit aussi les aider à faire face à leur situation tout en abordant les problèmes de la confidentialité, des droits, des responsabilités et du consentement éclairé. Ces deux films vidéo destinés à la formation de consultants (le premier en anglais, le deuxième en français) ont été choisis parmi plusieurs autres propositions sur le sujet.

Counselling has become a vital element in AIDS-related medical treatment or antibody testing. As well as helping people understand HIV infection, transmission routes and treatment possibilities, the care provider must help people to cope with their situation while addressing issues such as confidentiality, rights, responsibilities and informed consent. These two videos for counsellor training (the first in English, the second in French) were chosen from many submissions on the subject.

La vidéo offre toute une panoplie de méthodes pour poser un regard historique et analytique sur le sujet. Ce groupe éclectique d'artistes et de militants du monde des arts aborde les problèmes de la sexualité, de l'orientation sexuelle, du racisme, du sexisme, de la politique de la santé, de diverses phobies reliées au SIDA, des stéréotypes et de la considération du SIDA comme une catastrophe idéologique. Ces films vont de l'analyse visuelle à l'analyse textuelle en essayant de comprendre comment s'articule le discours sur le SIDA.

Video offers the use of a myriad of historical and analytical methods. This diverse grouping of artists and aesthetic activists touches on issues of sexuality, sexual orientation, racism, sexism, politics of health, various AIDS-related phobias, stereotyping and confronting AIDS as an ideological catastrophe. It ranges from visual to textual analysis attempting to understand the construction of AIDS discourse.

Mères, filles, amantes, travailleuses, lesbiennes, malades, militantes, prostituées, soignantes : les femmes sont vues de multiples manières à travers le prisme du SIDA. Ces films s'attaquent à la marginalisation des femmes sous divers angles. Chacun dépeint les luttes particulières des femmes face au SIDA et à l'infection par le VIH.

Mothers, daughters, lovers, workers, lesbians, patients, activists, prostitutes and caregivers: women are depicted in many ways in relationship to AIDS. From various viewpoints, these videos challenge the marginalization of women. Each depicts the special struggles which women face in relation to AIDS and HIV infection.

Le militantisme artistique et la résistance culturelle face au SIDA ont entraîné une prolifération de films et de vidéos. Cette séance en présente parmi les meilleurs. Des défilés de mode provocateurs aux vidéos musicaux subversifs, de la désobéissance civile à l'analyse critique des médias, les stratégies esthétiques illustrées prouvent qu'il ne faut pas seulement réinventer la politique du SIDA mais aussi le langage du SIDA.

Aesthetic activism and cultural resistance in response to AIDS has meant a proliferation of videos. This session is a sampling of some of the best. From guerrilla fashion shows to subversive music videos, from civil disobedience to media deconstruction, the aesthetic strategies illustrated show that not just the politics of AIDS but the politics of language related to AIDS needs to be reinvented.

Les clips
Clips

16:00 Introduction: René Lavoie

16:15 W.I.V.15 Clips télévisés du monde entier
Television spots from around the world

Les campagnes de prévention restent le principal moyen d'informer le grand public. Beaucoup d'organismes, gouvernementaux et communautaires, ont essayé d'intervenir en utilisant les techniques médiatiques existantes comme les messages télévisés d'intérêt public ou des clips spécialisés pour les lieux publics.

Ces clips sont réservés ou conservateurs, explicites ou hilarants, réactionnaires ou fascinants. Ils sont juxtaposés à dessein pour amener le public à choisir activement entre la peur et la prise en charge de soi.

Prevention campaigns remain the primary means of getting information to the general public. Many organizations, both government and community-based, have tried to intervene using existing media techniques such as Television Public Service Announcements (PSA's) or community-specific shorts intended for use in public venues.

These clips vary from coy to conservative, explicit to hilarious, reactionary to riveting. They are purposefully juxtaposed to force the audience to actively participate in choosing between promotion of fear or of empowerment.

La prévention reste le noyau fondamental de toute intervention contre le SIDA. Puisant dans le déluge de films vidéos proposés, cette séance présente un aperçu général des techniques de prévention mises en oeuvre pour de nombreux groupes cibles : toxicomanes, travailleurs du secteur de la santé et des services sociaux, personnels paramédicaux, prostituées, homosexuels et jeunes.

The nucleus of AIDS work remains prevention. From the deluge of videos submitted on the subject, this session provides an overview of prevention techniques for many target groups: drug users, health care workers, paramedics, prostitutes, gay men and youth.

Principaux commanditaires

Major Sponsors

Santé et Bien-être social Canada

Le Ministère de la Santé nationale et du Bien-être social est responsable des questions relatives à la promotion et au maintien de la santé, à la sécurité sociale et au bien-être social des Canadiens qui relèvent du Parlement du Canada. Des exemples de ses responsabilités sont l'application des lois touchant à la santé, à la sécurité sociale et au bien-être social des Canadiens; la conduite d'enquêtes et de recherches dans les domaines de la santé publique et du bien-être social; les services d'information sur les conditions et les pratiques sanitaires; les services de santé pour les Indiens et les Inuits, les habitants du Yukon et des Territoires du Nord-Ouest, les fonctionnaires fédéraux, les immigrants et le personnel de l'aviation civile; la coopération et la coordination avec les gouvernements provinciaux sur les questions de santé, de sécurité sociale et de bien-être social; et la collecte, la publication et la diffusion d'informations sur la santé, la sécurité sociale et le bien-être social.

Une importante partie des efforts que déploie le Ministère pour préserver et améliorer la santé et le bien-être social de tous les Canadiens exige la collaboration avec les autorités provinciales et territoriales. La nécessité de mener des activités conjointes dans certains secteurs découle de la division constitutionnelle des responsabilités et de l'existence de programmes fédéraux dont l'objet est d'aider les provinces et les territoires à assurer leurs propres programmes de services sanitaires et sociaux.

Les responsabilités et les activités du Ministère sont concentrées dans les principaux secteurs suivants : la sécurité du revenu pour les particuliers et les familles; les services sociaux de base, particulièrement pour les Canadiens défavorisés sur le plan socio-économique; l'universalité d'accès à des services de santé adéquats pour tous les Canadiens; la protection contre la maladie et les risques liés à l'environnement; la promotion de modes de vie sains; l'essor, l'encouragement et le développement de la condition physique et du sport amateur.

Les principales stratégies par lesquelles le Ministère s'acquitte de ses responsabilités sont les suivantes : transferts aux particuliers, transferts aux gouvernements provinciaux et territoriaux (sans oublier les groupes autochtones), recherche, réglementation et surveillance, services directs à des groupes particuliers, consultation, conseils, information et promotion.

Une brève description des divers programmes suit :

Services et promotion de la santé : Ce Programme assure un appui financier et technique aux provinces et territoires au titre des services de santé assurés et de certains services complémentaires de santé. Il encourage également l'adoption et la conservation de saines habitudes de vie, et stimule la recherche en santé publique.

Services sociaux : Ce Programme contribue à assurer de l'aide sociale et des services sociaux aux personnes qui n'ont pas les moyens financiers de satisfaire leurs besoins fondamentaux, ou qui, en raison de circonstances sur le plan social, sont exposés à la pauvreté, à l'isolement ou à la dépendance.

Services médicaux : Ce Programme assure des services de santé à plusieurs groupes de clients. Les principales activités s'adressent aux Indiens inscrits et aux Inuits de tout le pays, ainsi qu'à tous les habitants du Yukon et des Territoires du Nord-Ouest. Des services de santé sont également fournis aux fonctionnaires fédéraux, aux immigrants, aux résidents temporaires, aux voyageurs internationaux, au personnel de l'aviation civile, aux personnes physiquement handicapées et aux victimes de catastrophes.

Protection de la santé : Ce Programme vise à éliminer les risques pour la santé liés à des facteurs environnementaux, naturels ou artificiels, pouvant être cause de maladies et de décès prématurés. Les principales activités portent sur l'évaluation et le contrôle de la qualité et de la sécurité des aliments, ainsi que de la sécurité et de l'efficacité des médicaments et des appareils médicaux; l'identification et l'évaluation des risques liés au milieu; la surveillance des maladies; et la fourniture de services de laboratoire spécialisés.

Sécurité du revenu : Ce Programme a pour but de maintenir et d'améliorer la sécurité du revenu des Canadiens. Trois grands programmes de sécurité du revenu sont administrés : le Régime de pensions du Canada, la Sécurité de la vieillesse et des Allocations familiales. Un programme d'évaluation de l'invalidité est également appliqué dans le cadre de la Loi de l'impôt sur le revenu.

Condition physique et Sport amateur : Ce Programme contribue à améliorer la condition physique des Canadiens et à promouvoir l'excellence dans le sport amateur canadien sur les plans national et international.

Administration centrale : Ce Programme fournit au Ministère des services de direction et de gestion.

Health and Welfare Canada

The Department of National Health and Welfare is responsible for matters related to the promotion and preservation of the health, social security and social welfare of the people of Canada over which the Parliament of Canada has jurisdiction. Major examples of these responsibilities include administration of legislation relating to the health, social security, and welfare of the people of Canada; investigation and research into public health and welfare; information services relating to health conditions and practices; health services for Indian and Inuit people, residents of the Yukon and Northwest Territories, federal government employees, immigrants and civil aviation personnel; cooperation and coordination with provincial governments on matters of health, social security and welfare; and collection, publication and distribution of information relating to health, social security and welfare.

A significant amount of Departmental activity involves collaboration with provincial and territorial authorities in efforts to preserve and improve the health and social well-being of all Canadians. The need for joint activity in certain areas arises from the constitutional division of responsibilities and the existence of federal programs which assist provinces and territories to maintain their own health and social service programs.

Departmental responsibilities and activities are focused on the following principal objectives: income security for individuals and families; essential social services, particularly for socially and economically disadvantaged Canadians; universal access for all Canadians to quality health services; protection against disease and environmental hazards; promotion of healthy lifestyles; promotion, encouragement and development of fitness and amateur sport.

The major strategies through which the Department carries out its responsibilities are: transfers to individuals, transfers to provincial and territorial governments and to native groups, research, regulation and surveillance, direct service to specific groups, advice, consultation, information and promotion.

Following is a brief description of the various programs:

Health Services and Promotion: This Program provides financial and technical support to the provinces and territories for insured health care services and certain extended health care services. The Program also promotes the adoption and maintenance of healthy lifestyles and fosters public health research.

Social Services: This Program supports the provision of social assistance and services to persons whose economic circumstances are inadequate to meet their basic needs or whose social circumstances expose them to risk of poverty, isolation or dependency.

Medical Services: This Program provides health services to several client groups. The major activities are directed towards registered Indians and Inuit throughout Canada and residents of the Yukon and Northwest Territories. Clients also include federal public servants, immigrants and temporary residents, international travellers, civil aviation personnel, the physically handicapped and disaster victims.

Health Protection: This Program endeavors to eliminate health hazards associated with the natural and man-made environments that lead to illness and untimely death. Principal activities include: assessment and control of the quality and safety of food, and safety and effectiveness of drugs and medical devices; the identification and assessment of environmental hazards; the surveillance of diseases; and the provision of specialized laboratory services.

Income Security: This Program is responsible for maintaining and improving the income security of the people of Canada. It administers three major income security programs: The Canada Pension Plan, Old Age Security and Family Allowances. It also assists in the administration of the Income Tax Act through a disability certification.

Fitness and Amateur Sport: This Program contributes to the increased fitness of Canadians and the promotion of excellence in domestic and international amateur sport by Canadians.

Departmental Administration: This Program provides executive direction and management services to the Department.

ACDI

Créée en 1968, l'Agence canadienne de développement international (ACDI) est l'organisme du gouvernement fédéral responsable de la gestion d'environ 75 % de l'aide publique au développement accordée par le Canada aux pays en développement.

Depuis 1987, l'ACDI participe à la lutte contre le SIDA dans le monde en appuyant le Programme mondial de lutte contre le SIDA (PMLS) de l'Organisation mondiale de la santé ainsi que les programmes nationaux de lutte contre le SIDA. L'ACDI estime que les efforts déployés pour lutter contre le SIDA dans les pays en développement devraient également permettre d'améliorer et de renforcer les systèmes de soins de santé primaires établis dans ces pays.

L'aide de l'ACDI vise principalement à soutenir les cinq stratégies communes à la plupart des programmes nationaux de lutte contre le SIDA, notamment : le contrôle épidémiologique; la prévention contre la transmission de la maladie par relations sexuelles, par la transfusion sanguine ou autres produits sanguins, ou encore pendant la période périnatale; et la réduction des effets du SIDA sur les individus et sur la société.

À l'intérieur de ce cadre d'intervention très large, l'ACDI a apporté son soutien à la réalisation d'enquêtes sur la connaissance du SIDA, sur les attitudes à son égard et sur les pratiques sexuelles; à diverses initiatives en matière d'information, d'éducation et de communication; à la lutte contre les maladies transmises sexuellement; aux traitements palliatifs; aux services de conseils aux personnes infectées et à leurs partenaires; à la protection des réserves nationales de sang; au perfectionnement du personnel de laboratoire et des méthodes de diagnostic. Les compétences des universités canadiennes, d'autres organismes gouvernementaux et des organisations non gouvernementales ont rendu possible la mise en place d'un bon nombre de ces activités et continueront à favoriser la réalisation d'autres initiatives de ce genre.

Les engagements financiers de l'Agence en matière de lutte contre le SIDA, atteignent actuellement plus de $45 millions. L'ACDI est l'un des plus importants donateurs au PMLS, lui ayant fourni la somme totale de $14,5 millions de 1987 à 1989.

À travers ses programmes bilatéraux, l'ACDI appui des programmes pluriannuels dans de nombreux pays d'Afrique, des Antilles et de l'Amérique latine, dans le cadre de leurs programmes nationaux de lutte contre le SIDA. Ainsi, l'ACDI s'est engagée à verser $6,3 millions à l'Afrique anglophone et $22,8 millions à l'Afrique francophone : ces sommes permettront la réalisation de différents projets, dont la préparation d'une brochure d'information en portugais qui sera distribuée au Mozambique ainsi que d'un programme intensif de huit ans, mis en oeuvre en Afrique francophone. Les interventions réalisées dans le cadre de ce programme seront concentrées dans les domaines de l'information, de l'éducation, de la communication, du perfectionnement des ressources humaines, de l'épidémiologie et des études en anthropologie.

En Amérique latine et aux Antilles, l'ACDI a accordé $3,2 millions pour l'exécution de programmes régionaux et nationaux de lutte contre le SIDA.

D'autre part, la Direction générale des Programmes spéciaux de l'ACDI a affecté $1,4 million à la réalisation de trois projets de lutte et d'information administrés par des organisations non gouvernementales. Dans le cadre de ces projets, on préconise l'utilisation d'une bande dessinée conçue à l'intention des enfants de la rue ainsi que celle de documents d'information que distribuera la Fédération internationale de planning familial.

D'autres projets sont actuellement à l'étude et il est à prévoir que la contribution de l'ACDI à l'effort international de lutte contre le SIDA augmentera à la faveur de la naissance de nouvelles initiatives et de la mise en place de nouveaux programmes nationaux de lutte contre le SIDA.

CIDA

Created in 1968, the Canadian International Development Agency (CIDA) is the federal government agency responsible for approximately 75 per cent of Canada's official development assistance to developing countries.

Since 1987, CIDA has contributed to the global fight against AIDS by supporting the World Health Organizations's Global Program on AIDS (GPA), and national AIDS control programs. The Agency sees AIDS-control efforts as opportunities to complement and strengthen existing primary health cars systems in developing countries.

CIDA's assistance primarily supports five basic strategies common to most national AIDS control programs: epidemiological surveillance; prevention of sexual transmission; prevention of transmission through blood and blood products; prevention of perinatal transmission; and reduction of the impact of AIDS on the individual and society.

Within these broad approaches, CIDA has supported surveys of AIDS knowledge, attitudes concerning AIDS and sexual practices; information, education and communication initiatives; control of sexually transmitted diseases; palliative care; counselling of infected individuals and their partners; protection of national blood supplies; and upgrading of laboratory personnel and diagnostic procedures. The expertise of Canadian universities, other government agencies, and non-governmental organizations has been instrumental in many of these endeavors, and will contribute to future initiatives.

The Agency's spending commitments on AIDS control projects now total over 45$ million. CIDA is among the largest donors to the GPA, having contributed a total of $14.5 million from 1987 to 1989.

Through the bilateral channel, CIDA supports multi-year programs in many African, Caribbean and Latin American countries, within the context of their national AIDS control programs. CIDA has committed $6.3 million in Anglophone Africa, and $22.8 million in Francophone Africa. Projects range from the preparation of an AIDS information pamphlet in Portuguese for distribution in Mozambique, to an eight-year intensive project in Francophone Africa, focusing on information, education, communication, human resource training, epidemiology, and anthropological studies.

In Latin America and the Caribbean, CIDA has designated $3.2 million for sub-regional and national AIDS control programs.

Through the Special Programs Branch, $1.4 million has been allocated to three projects administered by non-governmental organizations involving AIDS control or information. These projects include an instructional cartoon for street children, and support for the dissemination of information by the international Planned Parenthood Federation.

A number of additional projects are in the discussion phase, and CIDA's contribution to international AIDS programming is expected to increase as new initiatives and more national programs develop.

Centre de recherches pour le développement international

Le CRDI est une société d'État créée par le Parlement du Canada en 1970. La mission du CRDI consiste à favoriser le développement du Tiers-Monde par la recherche et des activités connexes.

Par "développement", le CRDI désigne le processus d'évolution sociale et économique constant en vertu duquel les habitants d'un pays parviennent à déterminer quels changements ils devraient apporter à leur société et comment effectuer ceux-ci. Pour cela, les pays en développement doivent participer à la prise de décision sur un pied d'égalité avec les autres pays et doivent profiter pleinement des conséquences du changement. Cette forme de développement permet aux habitants du Tiers Monde d'améliorer leurs conditions de vie sans pour autant sacrifier leur dignité et le respect d'eux-mêmes.

Le CRDI est convaincu que cette forme de développement est plus susceptible de se manifester quand une population mange à sa faim, est en bonne santé, manifeste un esprit d'indépendance, est fière de ses réalisations, respecte les droits d'autrui et voit les autres respecter les siens. C'est pourquoi elle parraine les recherches destinées à faire naître ces conditions.

Objectifs

Le but principal poursuivi par le CRDI est de soutenir la recherche pertinente au développement et dont les résultats probables faciliteraient les activités dans ce domaine. Le Centre s'intéresse particulièrement aux projets qui se concentrent sur les problèmes liés à la pauvreté.

En deuxième lieu, il vise à consolider les capacités de recherche des pays en développement. Comme il préconise une intégration suffisante de ses activités, le Centre prend grand soin de rattacher l'aide qu'il prodigue en formation aux projets et aux programmes de recherche qu'il soutient.

Son troisième objectif est de promouvoir la diffusion, la vulgarisation et l'application des résultats des projets qu'il parraine.

Un quatrième objectif consiste à établir des liens entre les scientifiques des pays en développement et à aider ceux-ci à avoir accès aux résultats des travaux poursuivis un peu partout dans le monde.

Pour y parvenir, le CRDI finance des groupes et des établissements de recherche dans les pays en développement et soutient des réseaux et des organismes régionaux dans le Tiers Monde. Ainsi, il espère créer un noyau de chercheurs dans chaque pays et favoriser le développement de réseaux de personnes et d'établissements qui disposeront des ressources nécessaires à la réalisation des projets de recherche et à l'exploitation de leurs résultats.

Depuis 1970, le CRDI a ainsi contribué à plus de 3 500 projets auxquels participent au-délà de 10 000 scientifiques de 900 établissements répartis dans plus de 100 pays.

Bureaux

Le CRDI compte sept bureaux—le siège social, à Ottawa, et six bureaux desservant diverses régions des pays en développement : Bogota, Colombie; Le Caire, Égypte; Dakar, Sénégal; New Delhi, Inde; Nairobi, Kenya; Singapour.

Pour de plus amples renseignements sur le CRDI et les projets subventionnés par le CRDI dans les pays en développement, veuillez vous adresser à :

International Development Research Centre

IDRC is a public corporation created by the Parliament of Canada in 1970. IDRC's mission is to contribute to development in the Third World through research and activities which support research.

IDRC uses the term "development" to mean a continuing process of social and economic change in which people have the power and ability to decide what changes to make in society, and how to make them. They must be able to participate equally in these decisions, and to share fully in the results of change. This kind of development makes people's lives materially better and encourages a sense of dignity and self-respect.

IDRC believes that this kind of development is most likely to happen when people eat properly, are healthy, have a sense of independence, are proud of their achievements, respect the rights of others and have their rights respected. It supports research which tries to foster these conditions.

Objectives

IDRC's main objective is to support research relevant to development and whose likely results could be used in development work. The Centre is especially concerned with research on the problems of poverty.

A second objective is to build up the research capacity and capability of developing countries. Since it wants its activities to be relatively well-integrated, the Centre very carefully links most of its support of training to research projects and programs it supports.

A third objective is to promote the diffusion, popularization and application of the results of the research which the Centre supports.

A fourth objective is to develop links among developing country researchers, and to provide them access to the results of world-wide research.

To achieve these objectives, IDRC funds research groups and institutions in developing countries, and provides some support to regional networks and institutions in the Third World. This support is designed to build a corps of researchers in each country, and to help develop the networks of people and institutions which provide the services needed to get research done and to use its results.

IDRC has supported more than 3,500 projects involving over 10,000 researchers in 900 institutions in more than 100 countries.

Offices

IDRC has its headquarters in Ottawa plus six regional bureaus to service particular regions of the developing world: Bogota, Colombia; Cairo, Egypt; Dakar, Sénégal; New Delhi, India; Nairobi, Kenya; Singapore.

For more information on IDRC or IDRC-funded projects in the developing wold, contact:

Qu'est-ce que l'OMS?

L'Organisation mondiale de la Santé (OMS), institution spécialisée des Nations Unies créée en 1948, a 166 états membres. Elle agit en tant qu'autorité directrice et coordonnatrice, dans le domaine de la santé, des travaux ayant un caractère international. Les organes directeurs de l'OMS sont l'Assemblée mondiale de la Santé, "parlement" de la santé publique qui se réunit deux semaines par an, et le Conseil Exécutif, composé de 31 experts de la santé qui se réunissent deux fois par an.

Le secrétariat de l'OMS comprend environ 5 000 spécialistes opérant dans plus de 100 pays. Quelques-uns d'entre eux travaillent au siège de Genève et collaborent avec six bureaux régionaux en Afrique, dans les Amériques, en Méditerranée orientale, en Europe, en Asie du Sud-Est et dans le Pacifique occidental.

Les états membres contribuent directement au budget ordinaire de l'OMS—plus de 300 millions US $ par an—et des contributions volontaires additionnelles, qui doublent pratiquement le budget de fonctionnement, financent des programmes spéciaux tels que le SIDA, la reproduction humaine, les maladies diarrhéiques et la recherche concernant les maladies tropicales.

La "Santé pour Tous" est le principal but de santé sociale que se sont fixés les gouvernements et l'OMS pour les décennies à venir. De nombreuses organisations non gouvernementales apportent leur appui et les individus sont encouragés à "s'aider eux-mêmes". La "Santé pour Tous" a été définie par l'Assemblée mondiale de la Santé comme "un niveau de santé qui permette aux gens de mener une vie socialement et économiquement productive".

Sous la tutelle impartiale de l'OMS, les pays ont au cours des 40 dernières années combattu ensemble les fléaux de l'humanité. Un exemple en est la variole, la première maladie mortelle jamais éradiquée de la surface du globe. L'OMS s'est maintenant engagée à éradiquée la poliomyélite, qui paralyse encore quelque 275 000 enfants chaque année. Grâce au programme de l'OMS de lutte contre la cécité des rivières, des millions d'enfants d'Afrique de l'Ouest ne deviendront plus aveugles. En 10 ans, le pourcentage des enfants vaccinés contre six maladies mortelles est passé de 5 à plus de 50%. À ce jour, plus de 100 gouvernements ont adopté la liste modèle de l'OMS des 200 médicaments considérés comme essentiels.

Les succès sont nombreux, mais les défis restent impressionnants. Des millions de gens sont encore pris dans un cercle vicieux de pauvreté, de malnutrition et de maladie et n'ont pas accès aux soins médicaux, à une eau saine et à des systèmes d'élimination des déchets. La pandémie de SIDA exigera pendant de nombreuses années une mobilisation mondiale. Pour relever ces défis, l'OMS souligne que l'engagement politique et la participation des populations seront des facteurs essentiels.

What is WHO?

The World Health Organization (WHO), a specialized agency of the UN created in 1948, has 166 Member States. Its mandate is to act as the directing and coordinating authority on international health work. The two governing bodies of WHO are the World Health Assembly—a public health "parliament" which meets for two weeks every year—and the Executive Board, composed of 31 health experts who meet twice a year.

The Secretariat of WHO comprises some 5,000 specialists working in more than 100 countries. Of these, about 1,500 work at the headquarters in Geneva and there are six Regional Offices in Africa, the Americas, the Eastern Mediterranean, Europe, South-East Asia and the Western Pacific.

Member States contribute directly to the WHO regular budget—over US $ 300 million per year—and additional voluntary contributions, which virtually double the working budget, support special programmes such as AIDS, human reproduction, diarrhoeal disease control and tropical disease research.

"Health for All" is the main social health target of governments and WHO for the coming decades. Valuable support to achieve this goal comes from numerous nongovernmental organizations, and much emphasis is placed on helping individuals to help themselves. Successive World Health Assemblies have defined "Health for All" as "a level of health that will permit people to lead a socially and economically productive life."

Under the "neutral umbrella" of WHO, countries have, over the past 40 years, cooperated to combat together the scourges of humanity. An example is smallpox, the first killer disease ever to be eradicated from the world. Now WHO aims at eradicating polio, which still cripples about 275,000 children every year. As result of WHO's river blindness control programme, millions of children in West Africa no longer risk going blind. Immunization coverage of children against six killer diseases—measles, tuberculosis, whooping cough, tetanus, polio and diphtheria has increased from 5% to over 50% in 10 years. To date, more than 100 governments have adopted the WHO model list of 200 drugs considered essential for good medical practice.

The list of achievements is very long but the challenges that remain are daunting. Millions of people are still trapped in a vicious cycle of poverty, malnutrition and disease, and have no access to medical care, clean water and safe waste disposal. The AIDS pandemic will require a global mobilization for many years to come. To meet these challenges, WHO underlines that the vital factors will be political commitment and people's involvement.

Ministère de la Santé et des Services sociaux

Le Québec s'est doté d'un premier plan d'action sur le SIDA en 1987. Un groupe de travail, formé d'experts et de professionnels, a alors été constitué afin de fournir des éléments de réponse sur les questions éthiques et légales, la prévention, les soins, les aspects psychosociaux et la recherche.

La synthèse de ces travaux est devenue la principale source d'information à la base de la deuxième phase du plan d'action lancé par la Ministre de la Santé et des Services sociaux à l'occasion de la Journée mondiale du SIDA, le 1^{er} décembre 1988. Cette phase II comporte des mesures regroupées dans plusieurs champs d'activités avec prédominance de la prévention.

La prévention, par l'information et l'éducation, demeure encore le moyen le plus efficace de lutte contre le SIDA. Le Québec a identifié plus particulièrement quatre clientèles auprès desquelles devront s'articuler les efforts: la population en général, le milieu scolaire et la jeunesse, les personnes susceptibles de contracter le SIDA et celles avec lesquelles elles ont été en contact, et enfin certains groupes-cibles.

Le plan prévoit aussi des mécanismes d'information et de support pour toute personne désireuse de connaître sa situation par rapport au SIDA, des services de dépistage et de counseling, des subventions à des organismes communautaires pour des fins de support et d'entraide, des modalités pour la surveillance épidémiologique et des mécanismes de surveillance éthique relativement aux enquêtes de séroprévalence. Par ailleurs, des activités de formation et d'information sont prévues pour le personnel du réseau de la santé et des services sociaux, qui regroupe plus de 900 établissements.

En matière de soins hospitaliers, le plan d'action prévoit l'accessibilité à des services dans l'ensemble des centres hospitaliers québécois ainsi que la mise en place d'unités SIDA d'un maximum de 20 lits.

Pour les services complémentaires, l'orientation qui a été développée consiste à répondre aux attentes des malades qui souhaitent demeurer le plus possible dans leur milieu de vie ou dans un contexte qui lui ressemble. Ainsi, des projets pilotes de maisons d'hébergement ou de familles d'accueil spéciales et un programme de soins et d'aide à domicile sont mis en place.

L'évolution rapide de la maladie et l'état précaire des connaissances sur ce sujet nécessitent un accroissement des efforts en matière de recherche. Des fonds seront donc investis dans le développement de la recherche psychosociale et biomédicale et dans le perfectionnement des chercheurs.

Enfin, toutes les interventions seront l'objet d'une coordination et d'une évaluation visant à mesurer leur pertinence eut égard aux objectifs visés et aux résultats escomptés.

SANDOZ

SANDOZ Ltd., dont le siège social est situé à Bâle en Suisse, emploie plus de 43 000 personnes dans le monde entier dans des domaines aussi divers que la recherche et le développement, la fabrication de produits pharmaceutiques, chimiques et de matières colorantes, la nutrition et les produits agricoles.

Les recherches effectuées par Sandoz touchent cinq domaines de la médecine : neurologie, cardiologie, endocrinologie, immunologie et dermatologie. Cette entreprise investit, à l'échelle mondiale, plus de 700 $ millions par an dans la recherche fondamentale et la recherche clinique. Les spécialités pharmaceutiques Sandoz comprennent des produits tels que le Parlodel (bromocriptine) et le Sandimmune (cyclosporine) qui représentent de grands progrès scientifiques. Ce dernier produit, en particulier, a ouvert la voie à la transplantation et à la maîtrise du système immunologique.

Sandoz contribue aux travaux de recherche des professionnels de la santé en parrainant des colloques sur la science et la médecine. Depuis plus d'un siècle, des hommes et des femmes chez Sandoz ont participé activement à une véritable révolution sociale. Grâce à leur esprit innovateur et leur désir de partager leurs connaissances scientifiques, leurs travaux ont permis des améliorations importantes dans les sciences médicales et la santé. C'est ainsi que certains médicaments les plus remarquables du XX^{e} siècle sont des produits provenant de la recherche entreprise par Sandoz.

Sandoz Ltd., with headquarters in Bâle, Switzerland, employs over 43,000 people around the world in research, development and manufacture of pharmaceuticals, chemicals and dye stuffs, nutrition and agricultural products.

SANDOZ directs its medical research into five main areas; Neurology, Cardiology, Endocrinology, Immunology, and Dermatology. The company invests more than $700 million annually in basic and clinical research worldwide. SANDOZ medications include such breakthrough products as Parlodel (bromocriptine) and Sandimmune (cyclosporine). The discovery of Sandimmune has opened the road to organ transplantation and, ultimately, to control of the immune system.

SANDOZ contributes to the work of the health care community through the sponsorship of medical and scientific education forums. In fact, some of the most notable and advanced medications of the 20th Century are products of Sandoz research. For over a century now, the men and women of Sandoz have been active participants in a veritable social revolution. Through their spirit of innovation and desire to share knowledge, their endeavors have contributed to major improvements in medical science and human health.

Société canadienne de la Croix Rouge

Red Cross Society

Chaque année, la Société canadienne de la Croix-Rouge vient en aide à un Canadien sur six. Elle dessert la population à partir de plus de 1 000 postes non officiels, 608 sections, 10 bureaux divisionnaires provinciaux et territoriaux, et 17 centres de transfusion sanguine au Canada. C'est le siège social à Ottawa qui est responsable du Programme du sang et des Services internationaux, et qui coordonne 16 services de santé et d'action communautaire au pays. Toujours au siège social, le Laboratoire central constitue le centre de consultation du système canadien de transfusion sanguine et veille à l'élaboration et au respect des normes établies à l'égard du sang et des produits sanguins. La Société cnadienne de la Croix-Rouge désire remercier la "Vancouver PWA Society" et le Comité des personnes atteintes du virus de l'immunodéficience humaine (CPAVIH) du Comité SIDA Aide Montréal (CSAM), pour leur aide au centre d'accueil et de repos pour les personnes atteintes du SIDA.

The Canadian Red Cross Society touches the lives of one in six Canadians every year. Its services are delivered through more than 1,000 informal units, 608 branches, 10 provincial/territorial divisions, and 17 blood centres across Canada. The National Office in Ottawa is responsible for the national blood program and international services, and co-ordinates 16 health and community initiatives across the country. The National Office includes the NRL (National Reference Laboratory), the reference centre for the national blood system, developing and monitoring the standards and quality of blood and blood products. The Canadian Red Cross Society gratefully acknowledges the assistance of the Vancouver PWA Society and the PWA Committee of CSAM (Comité SIDA Aide Montréal) in the operation of the PWA Rest and Welcome Centre.

L'Industrie des assurances de personnes au Canada

The Life and Health Insurance Companies in Canada

Cent soixante-cinq sociétés d'assurance-vie offrent leurs services aux Canadiens. En coordonnant ses efforts et en allouant des ressources financières, l'industrie canadienne des assurances de personnes est en mesure d'apporter une aide importante à la lutte contre le SIDA et de faire ainsi preuve d'initiative dans ce domaine.

En 1987, elle a mis sur pied un Groupe de travail des chefs de direction sur les projets concernant le SIDA pour faire face à la menace que constitue cette maladie dévastatrice pour l'industrie et l'ensemble de la société.

Le plus sûr moyen d'enrayer la propagation du SIDA étant la prévention, l'objectif principal des projets parrainés par l'industrie est donc l'information, en particulier celle diffusée en milieu de travail et auprès des jeunes. L'industrie a financé un certain nombre de projets à cet égard et est constamment à la recherche d'autres projets dignes d'intérêt.

Canadians are served by 165 active life insurance companies. Through collective action and funding, the life and health insurance companies in Canada have the opportunity to make a significant contribution to the fight against AIDS and to show leadership on this issue in this country.

In 1987, the life and health insurance industry formed a CEO Task Force on AIDS Projects in response to the threat this devastating disease poses to business and to society.

The life and health insurance companies in Canada consider prevention the one sure way to curb the spread of AIDS. Therefore, the primary focus for industry-sponsored projects is on education, especially among young people and in the workplace. The industry has funded a number of projects in this area and is continually seeking other projects appropriate for consideration.

ORGANON TEKNIKA

One of the companies that make up AKZO's Pharma Division, ORGANON TEKNIKA focuses its activities on the R&D, manufacturing and marketing of high-tech products for hospitals, blood banks and laboratories.

From its headquarters in Turnhout, Belgium, ORGANON TEKNIKA serves a worldwide market via 40 local companies in all important geographical regions and production sites in the Netherlands, Ireland and the United States of America.

ORGANON TEKNIKA provides a range of HIV diagnostics for a range of applications. The latest contributions to the diagnosis, monitoring or confirmation, of HIV-infection are VIRONOSTIKA ANTI-HIV UNI-FORM (compatible with testing procedures for HBsAg and anti-HBc), VIRONOSTIKA HIV antigen, VIRONOSTIKA anti-Core and VIRONOSTIKA anti-ENV, which will be introduced at the V International Conference on AIDS together with HIV-LIA. Accomplishments diagnostic system, which also includes for instance the HEPANOSTIKA line of HAV and HBV assays and an extensive series of modern tests and dedicated equipment for still other viral, bacterial, parasital and endocrinological parameters.

With more than 25 years of experience in the field—including the invention of worldwide accepted standards like ELISA—ORGANON TEKNIKA has become a trendsetter in the systematizing of diagnostic praxis.
